Description: Fresh water is a finite resource. Our expectation for both use and protection of Idaho's fresh water sources is increasing. Water right holders are using water more efficiently. Increased efficiencies can lead to water savings or, alternatively, increased consumption. Water supplies may not be as plentiful or reliable as they once were. Yet, at times, there is excess flood water that courses down Idaho's rivers and out to the ocean. Increased demand on fresh water resources has spawned tension and litigation among water users. Court decisions are hardening the rights and obligations of those who have an interest in water resources. The value and cost of water is increasing. Both private and government entities are attempting to anticipate the demands upon and changing supplies of fresh water and to ensure adequate fresh water supplies in the future. What are these attempts, who is participating, is there adequate coordination between players, and is there enough collective will and financing to secure Idaho's fresh water supplies?
