## RESEARCH INTERESTS

---

My research using animal models focuses on the neurobiological mechanisms underlying memory formation, with an emphasis on neural circuits of emotion. This work is both significant and timely to research on sex differences in Post-Traumatic Stress Disorder and drug addictions. The objectives of my research program are to 1) clarify the circuit mediating discrimination among environmental cues signifying safety, fear or reward, and to 2) identify the neuronal correlates of the behavioral sex differences seen in fear and reward responding in our safety-fear-reward discrimination paradigm. This is being accomplished using a combination of techniques which are in place in my current laboratory at Purdue University: behavior, *in vivo* single unit electrophysiology, and chemogenetics.
