

A Game Changing Mitigation Technology

HY-TEK Bio is a Maryland-based firm that utilizes a suite of patent-pending technologies to capture and eliminate greenhouse gases emitted from the combustion of fossil fuels.

We use enhanced photosynthesis to clean flue streams and produce large amounts of algae biomass and oxygen that can be sold into global markets.

HY-TEK Bio has embarked on a sustained path toward commercial success, proven in the lab and in our pilot-scale facility located at Baltimore's Back River Waste Water Treatment Plant.

Our plan is to implement four new industrial-scale bioreactors at Back River that will provide our initial mitigation revenue stream. These initial revenues will pay back investors and be used to install additional bioreactors that will exponentially increase our returns. The Time is Right. Not only will HY-TEK Bio provide a profitable way for firms to eliminate noxious toxins they emit, our process will allow firms to meet or exceed upcoming GHG emissions regulations.

HY-TEK Bio provides a clean and environmentally friendly way to create revenue streams and secure regulatory compliance.
