The American Phytopathological Society presents this important symposium. New concerns have surfaced concerning field crop rust diseases in recent years and nothing less than world food security is at stake.

Course description: The primary purpose of this inaugural Field Crop Rust Symposium is to “circle the wagons” among the scientific community to compare notes, exchange ideas, and forge new relationships. The idea is to make rapid progress on all rust diseases of major field crops by enhancing scientific communication, collaboration, and cooperation.

Why attend? The Field Crop Rust Symposium Program Committee, chaired by Erick DeWolf of Kansas State University, has developed a program that will encourage a cross pollination of ideas and discussion among the scientific community.

Who should attend? The Field Crop Rust Symposium is targeted at the scientific community, but commodity leaders, crop consultants, and others will also benefit from attending.
