## Why Sealcoat?

Sealcoating is the process of applying a refined tar or asphalt-based emulsion to a pavement surface to slow the rate of deterioration. The benefits gained from properly sealcoating these surfaces range from cost savings and improved aesthetics to structural protection.

Our select products help to protect your asphalt surfaces against damaging effects caused by UV rays, salts, oils, hydraulic fluid, and permeating gas.

## Proper Sealcoating Steps

The short term cost-saving benefits of not properly preparing a surface for sealcoating are quickly lost to the 2, 3 or 4 times a properly prepared surface will outperform an improperly prepared project.

We follow the sealcoating industry's prescribed standards for proper surface preparation and sealer application.

- Pot Hole & Surface Repairs
