

Samsung IP Phones

The smarter way to do business.

SMT-i6000 Series

The SMT i6000 Series of IP Phones change the rules in IP deployment and the user's experience.

The wireless SMT-i6011 and SMT-6021 deskphones offer completely integrated Wi-Fi and Bluetooth® which means no expensive cabling costs. The phones integrate with your smartphone when used with the Samsung Device Manager (SDM) application. HD Voice ensures your conversations are crystal clear.

All models in the i6000 series feature both wireless and wired network connectivity and an ergonomic design including:

- A distinctive 'floating' handset. This looks stylish, but its real purpose is functional rather than aesthetic, making it easy to pick up the handset from any direction or angle.
- Easy to configure and update: A simple USB drive lets you easily configure new phones and upgrade phone software.
- Intuitive operation. Buttons are grouped according to function and place convenient features including volume, do not disturb, voice mail, conference calling, hold, re-dial, call forwarding, call mute, call transferring and more at your fingertips. .
- Versatile connectivity. This includes a two-port Gigabit switch, headset port and a USB port.

Wireless Connectivity –i6011 and i6021

The SMT-i6000 series brings the strengths of both the deskphone and smartphone into a fully integrated solution providing advanced capabilities including:

- **Contact synchronization:** upload and synchronize contacts from your smartphone to your deskphone via SDM application.
- **Call sharing via Bluetooth:** Leverage the IP phone's powerful speaker phone or handset to hear and share calls on your smartphone via Bluetooth.
- **Call handover:** Install the Samsung WE VoIP app on your smartphone and move calls received on your desk phone to your smartphone and vice versa. You can also transition calls from a Wi-Fi environment to your smartphone without interrupting the call.

- **Extending feature access:** Using a tablet as an extender module. This gives greater flexibility at a lower cost than a more traditional proprietary extender module. An app linking the tablet to the desk phone provides up to 99 programmable buttons, (OfficeServ only), giving one touch access to functions or extension numbers with color coded status indication and name displays.
- **Wi-Fi hotspot:** Use your deskphone as a Wi-Fi hotspot. If the desk phone is connected to the network using its wired Ethernet cable, up to five devices can connect wirelessly to gain network access. This is useful in providing simple wireless networking in small offices or in buildings where cabling is difficult.
