Residents of Cimarron Development

Residents,

With all the requirements for greater bandwidth and faster internet in today's world, Consolidated Communications is gearing up to begin a Fiber Optic Overbuild Plan to provide Gigabit Services over our fiber optic network to all existing residential developments that are currently being provided service via copper plant in the Cimarron Community and neighboring Developments. Once completed this will allow all residential owners the option of much greater speeds and durability for their Internet needs. This will be a three step process. First our construction crews which will be Varcable will place the new Fiber Optic Lines. They will be boring this line in to prevent service damage and will restore ground back to original condition as best we can. In the second step you will see Splicers Inc Techs splicing the Fiber Network to provide service. Once splicing is complete then Consolidated Communications Marketing Team will be reaching out to you all to inform you that the Fiber Network is complete and ready for service. Be on the look out for Door Hangers on your front door which will notify you that crews will be working in your area and will need access to the utility easement. I look forward to working with you to provide the Residents of Cimarron Community with Fiber to the Home over Consolidated Communications Fiber Network.
