## Glasses for the blind

Lumen, a company that creates assistive tech to help people manage disabilities, has come out with glasses for the blind. Described by the company as “replicating the main features of a guide dog,” the glasses use the same technology as self-driving vehicles but scaled down to a wearable size to help a wearer navigate through their environment. The company said its solution responds to the need for a scalable assistive solution for the blind, with guide dogs being a costly alternative that currently helps only a small portion of the world’s blind and visually impaired.

The glasses have been tested by more than 250 blind individuals, and are currently in Clinical Investigation.
