The beauty odyssey

## submarine forest

From the abyssal depths to the crystal clear waters of lagoons, from the infinitely small of plankton to the infinitely big of giant algae, the ocean offers undersea woods made of extreme algae. Fruit of a perfect alchemy, this marine flora uses incredible adaptation strategies and formidable biochemical arsenals to ensure their survival in this hostile environment.

Survivor of the glacial era and the biggest natural cataclysms, algae, real queens of the oceans, stand the test of time and reign supreme in the ocean depths.

## mountains/volcanoes

From snowy peaks to turquoise blue lakes and volcanoes, the Alps, Pyrenees and Auvergne regions offer a wide variety of verdant flowering landscapes.

In these mountains characterised by their harsh climate and terrain, extreme conditions favour an astonishing plant biodiversity. This emblematic vegetation evolves in an exceptional environment made of ice and hot springs rising out of the bowels of the earth. Thus, after the cold winter, spring revives life under the white snow cover, like a painting endlessly renewed.

## provence

Between mountains and the azure Mediterranean sea, Provence with its 900 kilometres of coastline offers a mosaic of natural environments (sub-sea valleys, dunes, coastal lagoons, wild heathlands and scrublands) ecologically rich. The region also includes almost two-thirds of the French plants species.

Here, in the kingdom of cicadas and floral scents, flora has secretly developed effective tactics to fight against the harshness and aridity of this country in the scorching heat of the sun in the summer.
