3-Part Growth Stimulant Program for Trees

Spalding Trees, LLC provides a 3-Part Growth Stimulant Program for newly transplanted trees or for existing trees that have been damaged by construction or otherwise weakened. This treatment helps the tree to recover from “root shock”, to add additional roots and to promote new growth.

Bioplex Concentrate

This is a liquid bio-stimulant complex of naturally occurring plant vitamins, enzymes, hormones, amino acids, nutrient chelators, plant growth regulators, root specific growth stimulators, micronutrients formulated with a state of the art non phytotoxic tissue and soil penetrant.

Mycorrhizal Stimulants

When Mycorrhizal Stimulants are added to the soil, Mycorrhizae are formed when the fungal and the root tissue combine. Mycorrhizal root systems increase the absorptive area of roots from 10 to 1000 times, thereby improving the ability of the trees to utilize the soil resources. They form an intricate web that captures and assimilates nutrients, conserving the nutrient capital in soils.

2 year, 12-8-8 Fertilizer Tablets

These organic tablets with bioplex stimulant will release at a prescribed rate over a period of two years. The nitrogen, phosphate and potash ingredients assist the mycorrhizal fungi and the bioplex concentrate in stimulating the growth of the tree.
