

4 Pillars of AF Management

OHI EP Symposium

February 14, 2020

Joseph J Gard MD FACC FHRS

NORMAL SINUS RHYTHM

ATRIAL FIBRILLATION

ECG Diagnosis

NORMAL SINUS RHYTHM

ATRIAL FIBRILLATION

AF is Common

- The most common sustained arrhythmia
- 0.5 – 1% prevalence in general population
- @ 40 yo 1 in 4 develop AF over lifetime
- More common with age
- Median age is 75

AF prevalence increases with age.

Increased mortality with AF

AF is NOT a Lethal Rhythm but DOES have Morbidity

Stroke Risk
Symptoms

- Palpitations
- Dyspnea
- Fatigue
- Lightheadedness

Exacerbate co-existing conditions

- Heart failure or ischemia

The Impairment of Health-Related Quality of Life in Patients With Intermittent Atrial Fibrillation: Implications for the Assessment of Investigational Therapy

RESULTS

Across all domains of the SF-36, AF patients reported substantially worse QoL than healthy controls (1.3 to 2.0 standard deviation units), with scores of 24%, 23%, 16% and 30% lower than healthy individuals on measures of physical and social functioning, mental and general health, respectively (all $p < 0.001$). Patients with AF were either significantly worse ($p < 0.05$, published controls) or as impaired (study controls) as either PTCA or post-MI patients on all domains of the SF-36 and the same as heart failure controls on SF-36 psychological subscales. Patients with AF were as impaired or worse than study PTCA controls on measures of illness intrusiveness, activity limitations and symptoms. Associations between objective disease indexes and subjective QoL measures had poor correlations and accounted for <6% of the total variability in QoL scores.

CONCLUSIONS

Quality of life is as impaired in patients with intermittent AF as in patients with significant structural heart disease. Patients' perception of QoL is not dependent on the objective measures of disease severity that are usually employed. (J Am Coll Cardiol 2000;36:1303-9)

My approach

Pt education: AF diagnosis, its natural history (AF begets AF), and treatment options (including realistic expectations)

1. ID & Treat reversible risk factors
2. Stroke risk reduction
3. Manage symptoms
4. Avoid tachycardia mediated cardiomyopathy

A diagram shaped like a classical temple with a triangular pediment and a three-tiered base. The temple is composed of alternating dark grey and dark red vertical columns. The grey columns contain white text, while the red columns are empty. The text in the columns, from left to right, is: 'Manage Risk Factors', 'Manage Stroke Risk', 'Manage Symptoms', and 'Avoid Tachycardia Cardiomyopathy'. The base of the temple contains the text 'Patient Ed: AF Diagnosis & Natural History'. The background is a dark red color with a repeating pattern of small, faint hearts.

Manage Risk Factors

Manage Stroke Risk

Manage Symptoms

Avoid Tachycardia
Cardiomyopathy

Patient Ed: AF Diagnosis & Natural History

A diagram shaped like a classical temple with a triangular pediment and a three-tiered base. The temple is composed of alternating dark grey and dark red vertical columns. The red columns contain text, while the grey columns are empty. The text in the red columns, from left to right, is: 'Manage Risk Factors', 'Manage Stroke Risk' (highlighted with a red background), 'Manage Symptoms', and 'Avoid Tachycardia' followed by 'Cardiomyopathy' on a new line. The base of the temple contains the text 'Patient Ed: AF Diagnosis & Natural History'. The background is dark red with a repeating pattern of faint, stylized hearts.

Manage Risk Factors

Manage Stroke Risk

Manage Symptoms

Avoid Tachycardia
Cardiomyopathy

Patient Ed: AF Diagnosis & Natural History

Stroke risk is increased 4-5 fold for AF patients

Left Atrial Appendage

AF Risk of Stroke

- 4-5 fold increased stroke risk compared to non-AF.
- Annual risk of stroke similar for paroxysmal versus chronic
 - Paroxysmal AF (3.2%)
 - Chronic AF (3.3%)

Warfarin reduces stroke risk

Warfarin Challenges

1-3% annual risk of major bleeding on warfarin

INR monitoring

Time in therapeutic window

Dabigatran vs Warfarin

Rivaroxaban vs Warfarin

A Events in Per-Protocol Population

No. at Risk

Rivaroxaban	6958	6211	5786	5468	4406	3407	2472	1496
Warfarin	7004	6327	5911	5542	4461	3478	2539	1538

Apixaban was superior to warfarin in preventing stroke or systemic embolism, caused less bleeding, and resulted in lower mortality for AF patients. (Eliquis 2.13%/year risk major bleeding)

Watchman left atrial appendage occlusion

Chatterjee S. et al.; Ann Thorac Surg 2011;92:2283-2292
FF Syed, SJ Asirvatham Heart Rhythm 2011;8:194-198

A diagram shaped like a classical temple with a triangular pediment and a three-tiered base. The temple is composed of alternating dark grey and dark red vertical columns. The text is oriented vertically within the grey columns. The background is a dark red with a repeating pattern of small, faint hearts.

Manage Risk Factors

Manage Stroke Risk

Manage Symptoms

Avoid Tachycardia
Cardiomyopathy

Managing Symptoms

Heart Rate Control

Med(s) to slow heart rate

+/- Pacemaker to avoid
too slow heart rate

Pacemaker + AV node
ablation (PM dependent)

Rhythm Control

Antiarrhythmic drugs

Catheter ablation

Cardiac surgery (MAZE)

Cardioversion

Electric Shock

Medication

Catheter Ablation for Atrial Fibrillation

Single Ablation Outcomes

Multi-Ablation Outcomes

Rate vs Rhythm in AFFIRM

NO. OF DEATHS		number (percent)				
Rhythm control	0	80 (4)	175 (9)	257 (13)	314 (18)	352 (24)
Rate control	0	78 (4)	148 (7)	210 (11)	275 (16)	306 (21)

A diagram shaped like a classical temple with a triangular pediment and a three-tiered base. The temple is composed of alternating dark grey and dark red vertical columns. The red columns contain text, while the grey columns are empty. The background is a dark red with a repeating pattern of hearts, some of which are filled with diagonal lines.

Risk of AF

Metabolic Syndrome

Waist

HTN

Triglycerides

Low HDL

Impaired Fasting Glucose

Obesity and Atrial Fibrillation

Weight loss benefits AF patients with BMI ≥ 27

Weight Loss & Fitness significantly benefits AF patients with BMI ≥ 27

Sleep Apnea and Atrial Fibrillation

OSA Tx reduces AF risk after Cardioversion

Kanagala R *Circulation* 2003;107;2589

CPAP Improves AF Ablation Outcome

Risk Factor Modification and AF ablation

RFM Clinic q 3 months

Standard ACC/AHA guidelines

Target BP < 130/80; Target BMI ≤ 25; Lipids, OSA tx, smoking, EtOH

Aggressive Risk Factor Management

Weight Management and Exercise

- Educate for permanent lifestyle change
- Diet Plan
- Initial target: >10% weight loss. Final target: BMI <27 kg/m²
- Avoid weight fluctuation
- Exercise: 30 minutes for 3-4x per week
- Increase type and duration of activity up to 250 minutes per week

Hyperlipidaemia

- Initial lifestyle measures
- At 3 months: start statins if LDL >100 mg/dl
- Add fibrates if TG >200 mg/dl
- Start fibrates if TG >500 mg/dl

Obstructive Sleep Apnea

- Overnight sleep study
- CPAP if AHI ≥30; or ≥20/h with resistant HT or daytime somnolence
- Check adherence: regular CPAP machine data download

Hypertension

- Home BP diary: 2-3 x daily
- Reduce salt
- Start ACEI or ARB
- Target: <130/80 mmHg (at rest) & <200/100 mmHg (at peak exercise)

Diabetes

- Glucose tolerance test
- Lifestyle measures
- At 3 months: Metformin if HbA1c >6.5%
- Diabetes clinic

Smoking Cessation & Alcohol Abstinence (or reduction to 30g per week)

A diagram shaped like a classical temple with a triangular pediment and a three-tiered base. The temple is composed of alternating dark grey and dark red vertical columns. The grey columns contain white text, while the red columns are empty. The text in the columns, from left to right, is: 'Manage Risk Factors', 'Manage Stroke Risk', 'Manage Symptoms', and 'Avoid Tachycardia' followed by 'Cardiomyopathy' on a second line. The base of the temple contains the text 'Patient Ed: AF Diagnosis & Natural History'. The background is dark red with a repeating pattern of small, faint hearts.
