

# Enhanced Foliar Health With C20™

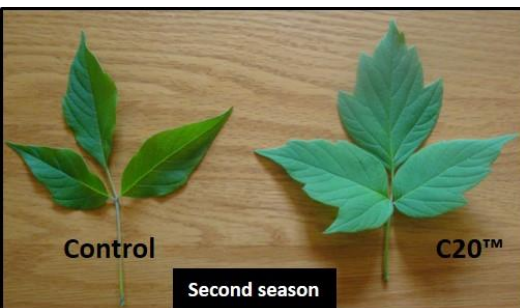

## Case Study #3:

*“Feed the soil microbes that feed your plants”*

Foliar effects of C20™ soil surface applications are observable within four to eight weeks. Leaves on treated plants are larger, darker and healthier. This effect continues into the second and third season post application.

This boxelder tree has a DBH of 11 inches. C20™ was applied as a top dressing in a 20” radius ring extending out from the base of the trunk of the tree after turf was removed.

The C20™ treated soil was then covered with wood mulch to a depth of two inches. Water was applied to the mulch ring after the application was completed.

***C20™ is ideal for treating trees, shrubs, and flowering plants in yards, gardens and landscapes.***
