

Neoplasm is an abnormal tissue that grows by cellular proliferation more rapidly than normal and continues to grow after the stimuli that initiated the new growth cease. **Neoplasms** show partial or complete lack of structural organization and functional coordination with the normal tissue, and usually form a distinct mass of tissue that may be either benign (benign tumor) or malignant (cancer).

Horizon Health Network knows that when dealing with **Neoplasm** outcomes it can involve a multidisciplinary approach that may include a health care provider that works directly with your doctor, nurses, medication management, aides, and in some cases counselors. **Horizon Health Network** can take care of all your home health care needs.
