VSAT-DIGITAL WIRELESS NETWORK PROJECT

The VSAT based Digital Wireless Network Project will offer Wireless High Speed Internet and VoIP Telephone Services to Urban and Rural Communities (Rural Telephony), at +1.5MB shared downlink to supply services to 7,500 Rural Subscribers/Users in designated Communities. The Project will receive its Satellite Feed from major providers of Satellite Telecommunication Services world-wide through a fleet of 40 satellites .

The High-speed Satellite Link would feed a series of transmission towers that will connect to the end users. The Network Architecture will be fed with a Satellite Link located at the Corporate Office, with the Satellite Dish Antenna located at the office. This will ensure the Project is completely independent from the sub-standard and inefficient local infrastructure and can be expanded on modular basis.

Estimated Cost including CIF, Installation, Training & Start-up from \$12.4million.
