

This is the E-Plex lockset at the PAPRC Buckland Range gates. This style of lockset is used because there is no AC power available on site. AC power there would cost \$20,000. It has a keypad which you don't use, a RF fob reader, turn handle and a metal tether which latches the chain into the lock. To gain access hold your HID fob against the black reader above the turn handle.

If your membership is paid the lock will activate and you can turn the handle and remove the chain tether. The lock will stay activated for 5 seconds. The lock records each activation.

To lock the gate the tether can be reinserted without activating the lock.
