

It's not just the turbines...

For example in Hopkinton... In November of 2017 the North Ridge project included the construction of a substation, access roads and breaker ring bus substation, the installation of 40 Gamesa turbines having a reactive power capability corresponding to a power factor of 0.95 lagging (overexcited) to 0.95 leading (underexcited), a 34.5/0.69 kV delta-wye, 2.35 MVA generator step-up transformer, 60/80/100 MVA non-regulated transformer and an electric feeder system and the laying of 61.79km (approximately 38miles) of transmission lines.

The following photos were taken in Churubusco, NY, approximately 40 miles from here.
