

Cost Effective IP - Based Access Control Solution:
No Server, No Software, No Power Supply, No Hosting
and No Classroom Training.

Situation:

Star Asset Security, a Monitor Dynamics' Integrator and an industry expert in high-end integrated security systems, turned to ASSA ABLOY Door Security Solutions with a new access control market demand within built environments: an access control system that would work on shared assets such as lockers, desks and unique rooms, but with the caveat that the employee could select any locker, desk or unique room on any given day and continuously change their selection throughout the week. Thus providing an access control solution for 24/7 personnel rotating shifts.

The solution didn't take days or months to achieve.

"It only took a few hours of joint discussion until one of our OEM partners, Monitor Dynamics, said they could design software to work with our products and make it all happen," according to S. Guerry Bruner, integrated solutions specialist at ASSA ABLOY. "And within two weeks they [Monitor Dynamics] had a working prototype. The ability to have those discussions, and work with companies that are nimble, willing and excited to take on the challenge means that when we have a new demand or need put in front of us, we get to solve it."

"It's another indication that the industry continues to see the need for innovation that is responsive and interoperable while remaining secure," Bruner added. "Our goal at ASSA ABLOY is to both protect the people and places that matter most, and to provide our clients with exciting new approaches to that high level of security technology. That collaboration with our industry partners, integrators, and end users is critical to this type of innovation."

AT&T Workplace 2020

FACILITY TYPE:

Corporate/Call-Center

NUMBER OF DOORS:

Over 100 custom
personnel lockers/14 doors

PARTNER HARDWARE:

aperio
HUB

aperio

- Education
- Energy/Utility
- Military Base
- Financial
- Museum/Public Facility
- Law Enforcement
- Government
- Place of Worship
- Private Business & Restaurant
- Healthcare

Cost Effective IP - Based Access Control Solution:
No Server, No Software, No Power Supply, No Hosting
and No Classroom Training.

Solution:

The new access control technology quickly fulfilled the need of the ATT - Workplace 2020 call center in Dallas, Texas. The iTRUST[®] access control technology coupled with the ASSA ABLOY Aperio Hub wireless locking system provides the solution for call center environments, and additionally offers and fulfills the need warranted by industries, such as healthcare, factories and organizations who have 24/7 rotating personnel.

"The system enables building owners and employers to provide new co-working concepts in shared spaces," says Sage Hirschy, director of business development at Star Asset Security. "Having a background in these types of workspaces we saw a need for a connected solution that is fully customizable to the customers' unique environment. We believe this system achieves that. Each day a different employee can access a locker, desk or unique space, such as sleeping quarters, without any changes in the access control platform. This removes the traditional need to set up access through a gatekeeper, reducing operational time and cost for facility managers."

iTRUST is a highly evolved, fully IP-based access control system and differentiates itself by being very easy to install, use and afford. iTRUST increases the comfort level for both the end user (ease of use based on computer experience) and the security installer (ease of installation based on networking capabilities) and is the clear choice for all organizations that are searching for a proven access control security system that is easy to afford, easy to purchase, easy to use, easy to install and easy to maintain. iTRUST delivers everything needed for quick implementation. No server is required (iTRUST 2.0) and there are no software license fees, maintenance upgrade charges or hidden costs. All software is contained on the board and is Powered Over Ethernet (POE). The software seamlessly integrates into existing systems and is capable of running LAMP (Linux, Apache, MySQL and PHP). IT/Security Officers can easily delegate enrollment and credential assignments from one or multiple desktops. Additionally, the iTRUST solution may be accessed remotely via any smart device.

Now One Powerful Solution
