# AfiSort SR

## An Extra Hand for the Sheep / Goats

---

Medium and large size sheep / goats farms treat a significant number of animals on any given day. Breeding, pregnancy, post partum, and veterinary treatment for sick animals are just a short-list of checks and examinations that farmers have to perform regularly.

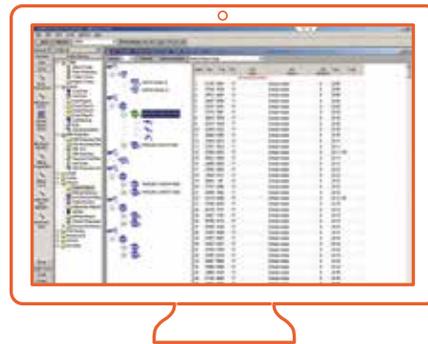

Tracking, selecting and monitoring is an important and demanding task for the herdsman. It is time consuming, requires data analysis, and can often result in animals being left unattended.

On a farm, tracing the targeted animals among an anonymous mass is as time consuming as finding a needle in a haystack. This task requires extra hands on the dairy farm.

The AfiSort SR Automated animal traffic control system is the most efficient solution for treating animals in a farm.

AfiSort SR is a computerized gate control system specially designed to direct animal traffic. Using the comprehensive AfiShepherd database, an accurate and consistent method of selecting and sorting animals is achieved automatically.

AfiSort SR is an essential tool in modern farming. It is a labor saving system that ensures that no animal is left unattended.

# Features

## Automated Animal Selection

---

**AfiSort SR** automatically traces the animals that need your attention every day. All you need to do is define the criteria for animals requiring attention and AfiSort SR does the rest. AfiSort SR controls the sort gates and separates the animals into their respective treatment areas according to your predefined instructions.

## Computerized Herd-Control

---

Leaving the milking parlor, selected groups of animals can be diverted to the treatment area. This capability is also used to automatically move animals between pens.

## Targeting animals for any Treatment

---

**AfiSort SR** is used for efficiently isolating animals for treatment. It enables quick checking/treatment of animals and avoids the need to stroll over large areas seeking out the animals for treatment.
