#### Introduction

For the secondary and higher education communities to achieve the timely, uniform, accurate, and secure exchange of academic records for current or previous secondary and postsecondary students, the Postsecondary Electronic Standards Council (PESC) has developed and approved a standard format in eXtensible Markup Language (XML) for the Response to a Student Transcript Request. This Implementation Guide provides the format for electronically responding negatively to an electronic request for high school *or* postsecondary education records (transcripts) and can help non-technical users to implement the electronic records exchange process.

Besides its obvious use for secondary and postsecondary educational institutions, this Guide may also be useful for software vendors and state and federal education agencies.

This Implementation Guide is based on the approved PESC XML Transcript Response Schema version 1.1.0. It is based on the Academic Record Sector Library Schema Version 1.6.0 and Core Main Schema Version 1.10.0. For the electronic exchange of these student records to be completely automated, it is essential that all users adhere strictly to the requirements of this Schema and understand and comply with the requirements outlined in this Guide.

### Typical Use Scenario for School to School Use

#### Request

When a person applies for admission (or re-admission) to a postsecondary school, the applicant typically provides information about previous schools attended. Typically, the applicant is asked to specify the last secondary school attended and all prior postsecondary schools.

The codes for these schools are then entered into the student information system (data base) for that student, along with other information from the application for admission.

On a regularly scheduled basis (usually after the close of business for that day), a batch program is run and each student (and applicant) on the school's data base is checked for all the previous schools the student listed, to prepare an electronic report of all previous schools. This report shows all schools previously attended for which:

- a. an official transcript for that school has not been received, and
- b. it has been determined that a transcript is needed according to school policy, and \*
- c. it has not been requested within the past "X" days.

After this program has been completed, another program will then create an electronic XML request for each transcript and send these XML requests through the Texas Internet Server to those schools, requesting an XML Transcript.

\* School policy will determine if transcripts are needed from every previous school attended. For example, some schools do not require transcripts from previous secondary schools if the student is a transfer from another postsecondary institution.

Likewise, some schools do not require transcripts from previous schools if the student is not seeking a degree at that school.

#### Response

The computer at the school (high school or postsecondary school) that receives the electronic request processes the XML Request for a Student Transcript as follows:

First, it attempts to match the requested student with a student on its data base to determine if the student does exist on the school's data base. The matching process typically includes:

- A match on any identifying student numbers provided in the request (SSN, school or state assigned ID number.
- If a match is found, then the school typically verifies with date of birth, or gender, or perhaps part of the student name to insure the correct student has been selected.

If a match has been found and verified, then the school's computer will typically prepare a request to send an XML transcript to the requesting school. That is typically done at a regularly scheduled time each work day. At that point, if the transcript is processed and sent successfully, nothing further is done and no other response to that request is required.

If a match was made, but the transcript could not be returned to the requestor, then the school's computer prepares an XML Response to a Request for a Student Transcript which will typically be sent once a day on a scheduled basis.

If a match was not made, then most schools will have someone in the Office of the Registrar do another search for the student's record using additional search criteria (alternate names, high school attended, dates of attendance, etc.) If no student is found that matches the data provided in the XML Request for a Student Transcipt, then the school's computer prepares an XML Response to that XML Request which will give the reason(s) that the transcript request could not be honored.

So for most cases, an XML Request for a Student Transcript will result in either an XML Student Transcript or an XML Response to the Request for a Student Transcript within one to three work days.

### **Organization and Format**

The schema for the Transcript is made up of four main parts:

- 1. Transmission Data
- 2. Request
- 3. Note Message
- User Defined Extensions

However, three of these main parts branch to form other parts, which in turn branch out further. This Guide is organized so that each level of branching is documented in the order as follows:

Transmission Data Level I
Sub-level IA
Sub-level IA1
Sub-level IA1a
Sub-level IA1b
Sub-level IA1c
Sub-level IA2
Sub-level IA2

Sub-level IA2b Sub-level IB Sub-level IB1 Sub-level IB1a Student Data Level I

(Etc.)

The heading for each level and sub-level indicates the position of the subsequent diagram in the larger Schema.

Following the heading, the diagram serves to illustrate its relationship with the preceding branch. All diagrams in this Guide were copied from a graphical representation of the Transcript Request Schema using a software package from Altova Corporation called XMLSpy.

#### Example:

The boxes in the diagrams can illustrate two separate components of the Schema: first, certain boxes show data element groupings which branch out to form either lower-level element groupings, or the Schema's other primary component, the fields that contain actual data. A box with a solid border indicates that that particular data element or field is required. A box with a dotted line indicates an optional data element or field. Likewise, a solid line connecting two or more boxes indicates that the boxes to the right in the diagram are required fields and a dotted line indicates the fields in the boxes to the right are optional. A plus (+) sign at the right of a box indicates that the element grouping or field branches beyond the scope of a given diagram. The Schema displays such branching in subsequent diagrams.

Each diagram includes a representation of a field or data element's repeatability. Under a given box, for example, "0...∞" would indicate an optional data element or field (with a minimum number of occurrences of zero) that can be repeated an infinite number of times. On the other hand, "1...3" would indicate a mandatory field (with at least one required instance) that can be repeated up to 3 times.

Although most data elements that could, theoretically, be included an infinite number of times in the schema, would typically only be included once or perhaps a few times. Including a high number of occurrences of a field would present problems for the receiving agency or institution.

Under each diagram, a table will appear with five columns:

**Tag Name:** This is the name of the data element grouping or field that will appear in the Schema and in the instance document. ("Instance document" refers to a transcript response with real data for an actual student or applicant that institutions would exchange.) The format for the tag name is Upper Camel Case which takes a name such as "Transmission

Data" and eliminates the space between the two words, retaining the capital letters of each word making up the tag name, e.g., TransmissionData.

**Schema Use:** This column indicates whether the data element or field is required or optional in the instance document. If a required field is not included in the instance document, the transcript request will normally be rejected by the receiving institution's computer program (XML Parser). This column will also include a notation if a field can be sent multiple times.

**Description:** This is a brief description of the data included with a particular XML tag name. The description normally comes from the description in the Core Main Schema for data elements.

**Recommended Use:** This column reflects recommendations from the developers of the Transcript Request Schema and generally recommended practices for exchanging electronic transcripts. Reaching consensus on the recommended use of data elements and fields has grown into an additional task for the PESC Workgroup.

Recommendations in this column generally match the standards in Schema Use, especially if Schema Use shows an element or field as "Required." However, a component listed as "Optional" in Schema Use may be listed as "Recommended" in Recommended Use if the PESC Workgroup or User Group regards the element or field as essential and in keeping with good practices in the AACRAO community.

**Required:** Indicates that a sending institution must include the data element or field in its transmission.

**Recommended**: If the information for a field is available at the school sending the response, then 'Recommended' indicates that the field should be sent.

**Conditional:** This recommended use may not occur, or does not occur often, in this Guide, but it may occur when the recommendation (recommended, optional or not recommended) is dependent on another data element being sent, or even on the value of another data element that is sent.

**Optional:** Indicates that it is generally up to the sender of the request to include the data or not.

**Not Recommended:** Indicates that, in the view of the original Workgroup or current User Group, such a data element or field should not form part of a transmission. In general, the Workgroup recommends that institutions not send notes or comments, since most Student Information System programs cannot automatically process them. Sending these elements could thereby slow or impede automatic processing by the school receiving the request. In some cases, common practice in a particular state or region or by users of a common vendor, may be to include data that are not recommended by the Workgroup.

In many cases, because of the reusability of complex data elements in XML, there are data elements included in this schema that may not be appropriate for use in the Transcript Response. In these cases, the recommended use may be designated as "Not Recommended."

**Format:** This column shows the minimum and maximum number of occurrences of the data element. It also shows the minimum and maximum length allowable for a field, if that field does not have enumerated values and is not a special type of field, such a date field.

"minOcc 1" indicates a required field, since it must have at least one occurrence in the instance document. "minOcc 0" indicates an optional field.

"maxOcc" followed by a number or symbol specifies the maximum number of times that an element can recur in an instance document at a particular position. For example, "maxOcc 5" would indicate that the field may occur no more than 5 times in a given position of the instance document. "maxOcc or indicates that a field may recur an unlimited number of times in the instance document. However, the use of an excessive number of occurrences puts a burden on the receiving agency or institution, so they should always be limited to the fewest number possible.

"minLength" indicates the minimum number of characters that a field must contain, while "maxLength" indicates the maximum number of characters that a field may contain. When these notations appear, it is assumed that the lengths refer to a character string made up of either letters or numbers or a combination of both, as well as common special characters.

"Enumerations" is used to list the allowable values that may be used in the instance document. They must be used exactly as shown in this column. When the values are enumerated in this column, "minLength" and "maxLength" will not be indicated and are not appropriate.

"DateTime" always uses the same format: ccyy-mm-ddThh:ii:ss(+GMT). An example would be "2005-11-20T08:15:36(+7)". Likewise, "Date" always uses the format "ccyy-mm-dd". An example would be "2010-11-20". If either DateTime or Date is used, then "minLength" and "maxLength" will not be indicated.

"xs:decimal" indicates a numeric field. It has a maximum length of 18 characters including a decimal if it is explicitly included. Typical values would be (1) a grade point average of "3.250"; (2) credits earned of "24"; or (3) credits included in GPA of "16".

"minInclusive" indicates the lowest value of a decimal type field that can be included, while "maxInclusive" indicates the maximum value that can be included in a decimal type field. "totalDigits" indicates the maximum number of digits that can be used in the specified field.

**Comments:** The Guide may include comments beneath the rows of a given table and/or at the end of the table. The Workgroup intends for these comments to provide further explanation for the items displayed. Comments refer to the row immediately above the comment row, except for a comment at the end of a table. In this case, the comment typically refers to the entire table.

**Code Illustration:** Below each table, the Guide includes a snippet of what that portion of an instance document might look like in XML format. If the data element is a required data element for the schema, then that data element will be in bold type.

If the code is illustrating a complex data element that will be further explained on a subsequent page of the Implementation Guide, then only the opening and closing tags will be included. For example:

<Birth>

If the code is illustrating a simple data element that is not recommended for inclusion, then an empty tag will be included. For example:

#### <NoteMessage/>

Appendix C shows an example of an XML Schema for a (Negative) Response to a Request for a Student Transcript. This example is not intended to match the Code Illustrations throughout the Guide, since a typical transcript request would not include many of the optional sections of the Schema.

**NoteMessage:** You will find "NoteMessage" appearing throughout the Schema. This Guide almost always recommends against the routine use of note messages. Unless there is a previously agreed upon format for a note message between the sender and the receiver, notes cannot be interpreted and automatically processed by the receiver's computer.

**UserDefinedExtensions:** The user-defined extension (UDE) design pattern is intended to address situations in which the current Schema does not accommodate sender-specific data. The Schema has to allow for additional elements that may be defined and used at a later date. The user-defined extensions pattern serves as a placeholder for these to-be-defined fields and elements. However, it can require that these fields be defined in a Schema by the organization that wants to use the extensions area.

Senders of transcript responses should take care not to use the user-defined extensions as a fall-back for doing appropriate research and design. They should only use the extension when, in actuality, the organization defining the base Schema cannot define the additional elements that other organizations may need. Furthermore, other recipients not interested in the data these specific organizations want to exchange in the user-defined area, may then just ignore the UDE.

User-defined extensions are beneficial when both the sending and receiving institutions agree on their use. For best work practice, the Workgroup recommends the use of user-defined extensions in the following scope:

- Mutually defined sub-schemas: For the transmittal and receipt of data agreed upon by both sending and receiving institutions;
- State or agency systems;
- Regional requirements.

The benefit of using the user-defined extensions stems primarily from the open nature of the XML design. Institutions may take advantage of XML's openness, use the user-defined extensions to accommodate data for which the original Schema has not accounted, and standardize the use of the extensions among themselves. Such institution-to-institution agreements allow for the following:

- Strict standardization among institutions through design and implementation agreements,
- Ability of users outside of the agreement to ignore the data contained in the user-defined extensions.

Because the Schema recommends that institutions develop their own agreements for the use of user-defined extensions, the Workgroup and User Group also recommend against the development of national UDE standards.

#### **Example Code:**

- <UserDefinedExtensions>
  - <YearTerm>20042</YearTerm>
  - <CourseAbbrev>ENG</CourseAbbrev>
  - <CourseNumb>0114</CourseNumb>
  - <SectNumb>02</SectNumb>
- </UserDefinedExtensions>

Please reference Excerpt from PESC Guidelines for XML Architecture and Data Modeling page 46 (http://www.pesc.org/info/policies/PESC-Guidelines-for-XML-Architecture-and-Data-Modeling-v3-0.doc) for a full explanation on the usage of user-defined extensions.

#### **Development History and Acknowledgments**

The American Association of Collegiate Registrars and Admissions Officers (AACRAO) Committee on the Standardization of Postsecondary Education Electronic Data Exchange (SPEEDE) began working on a national standard format for the electronic exchange of postsecondary student records in 1989. Initially the work of the committee was funded by AACRAO. At about the same time, the US Department of Education's National Center for Education Statistics (NCES) began developing a national standard format for the electronic exchange of student records for kindergarten through high school students. The K12 community was primarily represented by the Council of Chief State School Officers (CCSSO). To gain more credibility in the creation and widespread adoption of the standards, the two groups (AACRAO and NCES) approached the American National Standards Institute's (ANSI) Accredited Standards Committee (ASC) X12 for assistance in developing and approving the two standard formats.

ANSI ASC X12 reviewed the two proposals and insisted that only one standard be developed and approved. That standard would be the Kindergarten through Postsecondary Education Student Record. At that time, NCES decided to fund the travel of the AACRAO SPEEDE Committee as well as those working on the K-12 standard. The ASC X12 Standard in the Electronic Data Interchange (EDI) format was approved in the early 1990's as ANSI ASC X12 Transaction Set (TS) 130 for the Student Educational Record (Transcript).

After ANSI ASC X12 approved the Transcript format, the AACRAO SPEEDE committee began work on three additional transaction sets that now make up the Transcript Suite:

TS 131 – Acknowledgment of the receipt of an electronic transcript

TS 146 – Request for an electronic transcript

TS 147 – Response (usually negative) to a request for an electronic transcript

During this time period (before the Internet was widely available), the format stressed the transmission of as much data as possible using the fewest characters. This emphasis emerged because transmission costs were based on the number of characters or bytes being sent over the Value Added Electronic Networks (VANs).

The ASC X12 Standard is now in use by a significant number of postsecondary institutions in the United States and Canada. Approximately 1,000,000 student transcripts are exchanged electronically in the EDI format through the University of Texas at Austin Internet SPEEDE Server in the ANSI ASC X12 EDI format each year. At the secondary level, Florida and Texas schools exchange a significant number of electronic high school transcripts, because the state mandates the exchange in an electronic format. Iowa and Maryland also have significant exchange. The number of electronic transcript exchanges in the EDI format remains relatively small for secondary schools but is increasing at a rapid rate.

The number of transcripts exchanged electronically in the ASC X12 EDI format grows significantly (approximately 20%) each year. However, the education community felt that an alternative format should be explored. In the view of many, the perceived complexity of implementing the EDI standards was one of the reasons that many high schools did not use the EDI format.

The Postsecondary Electronic Standards Council (PESC) commissioned this exploration by creating the XML Forum (now known at the PESC Standards Forum). The purpose of the Forum was to determine if an XML format might result in significantly increased electronic exchange of student educational records.

The wide and inexpensive availability of XML software tools and the already existing and pervasive use of XML by many schools' information technology staffs made the XML process appear to have a much better chance of rapid acceptance and implementation by education institutions.

The early efforts of the XML Forum emphasized the creation of standard reusable core components. Once the Forum made significant progress with this work, PESC agreed to develop an XML Standard Format for the College Transcript to demonstrate that this could be done.

Bruce Marton from the University of Texas at Austin headed this effort and received the bulk of his support from the AACRAO SPEEDE Committee that had developed the earlier EDI standard.

PESC approved the XML standard for the College Transcript in May 2004.

The approval of the XML College Transcript generated considerable interest in the creation of an XML High School Transcript. Bruce Marton reviewed the ANSI ASC X12 EDI version of the transcript, which included both the College Transcript and the High School Transcript and noted many similarities.

Under Bruce's leadership, the AACRAO SPEEDE Committee created a very rough draft of a proposed schema for an XML High School Transcript in late summer of 2004.

The October 2004 PESC Meeting in Newport Beach, California, included a session on the draft XML High School Transcript Schema. Attendees expressed significant interest, and some formed an informal PESC Workgroup to review the draft and determine if it could be used to accelerate the development of a PESC XML High School Transcript.

The Workgroup began holding weekly conference calls and enhanced the rough draft from the end of 2004 through May 2005. PESC then sent out a press release to the wider educational community and invited anyone interested to participate in a special conference call on May 26, 2005. There were thirty-nine participants on that call. Many agreed to join the Workgroup and participate in future calls.

The Workgroup continued the weekly calls through 2005 and then posted the XML Schema on the PESC web site for review by a wider audience. The Workgroup completed its work in January 2006 and PESC approved the XML High School Transcript as a PESC Standard on June 9, 2006.

Mark Jones, a member of the Board of PESC and representing the National Student Clearinghouse (NSC), created a workgroup (composed largely of the AACRAO SPEEDE Committee) to begin to create two new XML schemas that would serve primarily the same purposes as EDI TS 146 (Request for a Transcript) and EDI TS 147 (Response to a Request for a Transcript). The NSC was interested in the two schemas to support a transcript request service that it planned to offer. The AACRAO SPEEDE Committee was interested in the two schemas to serve the same functions as the two EDI Transaction Sets.

Subsequently, Mark left the NSC and Doug Falk, also at the National Student Clearinghouse, replaced Mark on the PESC Board. Doug then also picked up Mark's role as chair of the workgroup to develop the two new schemas.

This Implementation Guide provides information to implement the XML Schema for the Response to a Request for a Student Transcript when used by one school to respond negatively to an electronic XML request from another school.

### **Transcript Response**

### Response.Receiver

Note: For school to school transmissions, this entire complex data element Response.Receiver is optional and it is <u>not recommended</u> to be included in the instance document. It is not recommended since it is exactly the same information that is included in the TransmissionData.Destination complex data element. However, if it were to be included, then either Person or RequestorReceiverOrganization must be included, but not both.

| Tag Name  | Schema<br>Use     | Description   | Recommended<br>Use                     | Format  |
|---|-------------------|---|--|---|
| Person  | Required          | The person who is the intended recipient of the student's transcript  | Required<br>Choice; Not<br>Recommended | minOcc 1<br>maxOcc 1                                |
| Comment: If the complex data                            | a element "Req    | uestorReceiverOrganization is included, the   | en this data element                   | would not be included.                              |
| RequestorReceiverOrganizati<br>on                       | Required          | This is the organization that made the request for the student transcript.  | Required<br>Choice; Not<br>Recommended | minOcc 1<br>maxOcc 1                                |
| Comment: If the complex data                            | a element "Pers   | son" is included, then this data element wou  | uld not be included.                   |   |

# Appendix D Changes Made to (Negative) Response to a Request for Student Transcript Since Version 1.0.0

#### Version 1.0.0

Version 1.0.0 used Core Main Schema Version 1.1.0 and Academic Record Sector Library Version 1.1.0.

#### Version 1.1.0

Version 1.1.0 uses Core Main Schema Version 1.10.0 and Academic Record Sector Library Version 1.6.0.

#### Changes made were

- 1. Birth Added new child data elements (BirthYear, BirthCity, BirthStateProvinceCode, BirthCountry, and Age.
- 2. Name Added a new child data element (NameCode) to identify the type of Name that is being included
- 3. Name Also added additional enumerated values to NameSuffix
- 4. Organization Organization uses a group to allow for a choice of code sets to be used to identify an organization (school). Previously, this was a required choice of one code set, e.g., FICE or ACT or CEEBACT, etc. This changed so that multiple code sets can be included to identify a school.
  - In addition, three new code sets were included that can be used to identify schools: PSS to identify private secondary schools in the US; PSIS, a new code set to identify postsecondary schools in Canada, and MutuallyDefined for use within a geographic or other area or to identify schools who use a common vendor.
- 5. AcademicAwardTitle This simple data element has been increased to a maximum length of 400 characters.
