## **Doctor Warns: Mammograms Increasing Breast Cancer**

Monday, March 24, 2014 05:18 PM

**By: S.A. Nickerson**

For women in the United States, death rates from breast cancer are higher than those for any other cancer except for lung cancer. Moreover, breast cancer is the most commonly diagnosed cancer among American women other than simple skin cancer.

In fact, nearly 30% of cancers in women are breast cancers.

The multibillion-dollar cancer treatment industry proclaims that death rates for breast cancer have fallen since 2000. However, Dr. Russell Blaylock, one of America's leading holistic physicians, disputes this notion. He reports that, in reality, breast cancer rates have continued to escalate over time, with this type of cancer becoming even more aggressive and lethal.

While Dr. Blaylock agrees that early detection of breast cancer is often a key to survival, he cautions that conventional medicine's recommendation for over-40 women to get mammograms every year or two years is just flat-out wrong.

And in his [free educational video presentation on breast cancer](#), he explains why mammograms are not part of the solution to breast cancer, but are, in fact, part of the problem.

In Dr. Blaylock's [special video report](#), you'll discover why mammograms are neither safe nor effective, and find out about better alternatives to these common breast cancer detection tests.

You'll see how the cancer treatment industry has manipulated cure rates for breast cancer to look more positive by including in their statistics one type of

test result that rarely develops into a true cancer — and how this manipulation has led to unnecessary cancer treatment and suffering.

Dr. Blaylock discusses how preventing the activation of latent cancer cells is actually your best defense against this deadly disease. He'll share with you the three things to avoid if you want to prevent the cell damage that leads to cancer development. Dr. Blaylock will also tell you how one certain food recommended by the majority of oncologists and cancer centers could actually cause cancer cells to grow faster and become more invasive.

If you or a loved one have concerns about breast cancer (and you should, given its prevalence), this video provides an excellent resource to help you discover what causes it, how to prevent it, and how to stop fueling its growth and spread.
