

Road Gravel Grinders

- Reduce Blading
 - Remove all defects
 - Blend all materials together
 - Inject water to reduce water haul
 - Get uniform moisture
- Extend Gravel Life
 - Blend chloride dust abatement additives
 - Add clay to increase binder

Testimonial

After working with the Mill Razor on several projects over the past two years, I consider it the most effective new tool available for gravel surface maintenance and stabilization. This road surface grinder quickly removes washboards, ruts, and potholes while eliminating gravel segregation and efficiently blending all gravel materials and water. The 12.5 foot wide grinder drum can totally recondition one lane in one pass while blending clay and chloride additives that will reduce blading maintenance and significantly extend gravel life.
