# EVIDENCE-BASED MODELS OF ADDICTION TREATMENT

### PRINCIPLES OF EFFECTIVE TREATMENT (NIDA)

- Addiction is a complex but treatable disease that affects brain function and behavior
- No single treatment is appropriate for everyone
- Treatment needs to be readily available
- Effective treatment attends to multiple needs of the individual, not just his or her drug abuse
- Remaining in treatment for an adequate period of time is critical
- Behavioral therapies—including individual, family, or group counseling—are the most commonly used forms of drug abuse treatment

### PRINCIPLES OF EFFECTIVE TREATMENT (NIDA)

- Medications are an important element of treatment for many patients, especially when combined with counseling and other behavioral therapies
- An individual's treatment and services plan must be assessed continually and modified as necessary to ensure that it meets his or her changing needs
- Many drug-addicted individuals also have other mental disorders
- Medically assisted detoxification is only the first stage of addiction treatment and by itself does little to change long-term drug abuse
- Treatment does not need to be voluntary to be effective

## PRINCIPLES OF EFFECTIVE TREATMENT (NIDA)

- Drug use during treatment must be monitored continuously, as lapses during treatment do occur
- Treatment programs should test patients for the presence of HIV/AIDS, hepatitis B and C, tuberculosis, and other infectious diseases as well as provide targeted risk-reduction counseling, linking patients to treatment if necessary
- Treatment varies depending on the type of drug and the characteristics of the patient.
   The best programs provide a combination of therapies and other services

- Cognitive-behavioral therapy (alcohol, marijuana, cocaine, methamphetamine, nicotine)
  - Emphasis on identifying high risk situations, developing strategies for managing them and coping/social skills training
- Contingency management/motivational incentives (alcohol, opioids, stimulants, marijuana, nicotine)
  - Contingency management (CM) principles = giving patients tangible rewards to reinforce positive behaviors such as abstinence.

- Community reinforcement plus vouchers (alcohol, cocaine, opioids)
  - Uses a range of recreational, familial, social, and vocational reinforcers, along with material incentives, to make a non-drug-using lifestyle more rewarding than substance use.
  - Focus on
    - improving family relations
    - Learning a variety of skills to minimize drug use
    - Receiving vocational counseling
    - Developing new recreational activities and social networks

- Motivational enhancement therapy (MET: alcohol, marijuana, nicotine)
  - Helps individuals resolve their ambivalence about engaging in treatment and stopping their drug use
  - Aims to evoke rapid and internally motivated change, rather than guide the patient stepwise through the recovery process.

#### STAGES OF CHANGE

- Precontemplation
- Contemplation
- Preparation
- Action
- Maintenance

- Matrix model (stimulants)
  - Multi-modality approach
    - Relapse prevention
    - Psychoeducation
    - Family sessions
    - Self-help group participation

- 12 step facilitation
  - An active engagement strategy designed to increase the likelihood of a substance abuser becoming affiliated with and actively involved in 12step self-help groups
  - Three key ideas
    - Acceptance
    - Surrender
    - Active involvement in 12-step meetings and related activities.

- Family Behavior Therapy
  - The family is the client
  - Therapists seek to:
    - Engage families in applying the behavioral strategies taught in sessions
    - Help families acquire new skills to improve the home environment
