Development of the DTD System

Development of the DTD System was accomplished using a three dimension methodology of Developing processes, Testing processes and Documenting Processes.

Analyzing existing methods of Configuration Management and Document Control along with hands on experience of methods used in a real time environments in a variety of industries has produced the a system maximizes resources to produce cost efficient methods. Including converting traditional paper based document functions of Configuration Management and Document Control into electronic document functions.

The components of the system were tested using stringent and innovative testing methods. Testing methods were designed for each component of the system.

System documents are designed for the system administrator to learn the usage of the system and in turn familiarize prospective users of the system in system processes quickly and easily.
