Precision, Power and Speed

SETTING A STANDARD FOR THE WORLD

Whether your job calls for laying pipe through a busy intersection, doing site prep for a new building, demolishing an existing structure, or performing general excavation work, there is a 90B Series excavator just right for you. From the

compact maneuverability of the 9010B to the massive strength of the 9060B, these exceptional excavators can meet or exceed your performance expectations with just the right combination of precision, power and speed.

The heart of any excavator is hydraulic performance, and you're getting the best with Case 90B Series excavators. The two variable displacement axial-piston pumps and matched control valves provide the highest level of production and precision. The 90B Series excavators give you added power

for the toughest digging conditions, combined flow from both pumps to accelerate crowd and hoist, and cushioning capability for smooth operation and precise control. A superior swing system minimizes attachment

oscillation and includes a mechanical swing brake. An auxiliary valve section is also standard for added versatility.

Operator comfort

contributes to productivity and efficiency. The operator environment of the 90B Series excavators is designed to be comfortable, efficient and informative. The LCD monitor is the first in the industry to provide easy-to-understand messages in words rather than symbols. Large glassed areas, including a skylight, give the operator an excellent overall view of

the work site, from overhead to the groundline and deep into the excavation. The seat and controls can be adjusted to custom-fit any operator. Vibration and noise are kept to a minimum through insulation and six fluid-filled mounts. Optional factory air conditioning is available. With operator fatigue and distractions at a minimum, productivity is increased, and so is your bottom line.

State-of-the-art controls harness the power and speed of

these remarkable machines for maximum productivity whether the job requires the precision of laying pipe or the power to raze a building. Extra power when digging, four work modes to maximize productivity and efficiency, and Automatic One-Touch deceleration are at the operator's fingertips.

Minimal downtime and fast servicing translate into maximum productivity. For the 90B Series excavators that includes: an on-board computer diagnostic system for decreased trouble-shooting time, a filtration

system that extends oil life and protects components, a redundant operating system to assure job completion and waterproof harness connectors for long-term reliability of the electrical system.

Technology combined with the practical for benefits beyond your expectations — the Case 90B Series excavators offer you the opportunity to experience the future.
