Turn-key Water Resource Development & Design

Managing the water supply for rural developments can be the most challenging part of site selection & development.

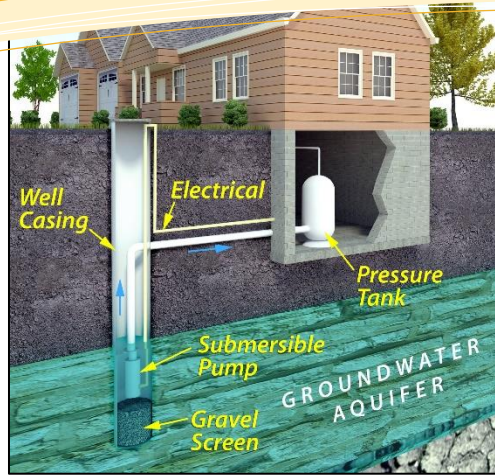

-Josh Hickman, PG

The limiting factor in rural estate development is often serving enough water to meet the needs of the home and grounds. HGC ensures that builders and homeowners select building sites and water development plans to ensure that the projected water needs of a project are met.

From site selection, to installation, to maintenance HGC will be there for our customers.

HGC is managed by a Professional Geologist in the State of Pennsylvania and employees

Professional Engineers to design our built-for-project water systems.

Does the Property Have Enough Water for the Proposed Use?

This is the first question HGC answers with our **Site Suitability Study**. The answer is found in the surrounding geology and neighboring water wells. When the report is provided, the owner and builder then know that the water they need for the development is available.

Advantages of the HGC Turn-key Support...

Financial: The Site Suitability Study ensures that your rural dream home estate has its own sufficient high-quality water supply.

Tax Savings: In many places, homeowners benefit from a federal or state tax credit to have a water well installed on the property for ongoing savings.

Quality Development: Proven engineered designs and experienced local drillers are used to tailor approach to each site-specific conditions.

Simplicity: With our one point of contact system, it only takes one call to get the work started and a solution provided.
