

## Sample Final - Solutions

1. Find the unit tangent and unit normal vector for the following vector functions

$$\vec{r}(t) = \left\langle t, \frac{1}{2}t^2 \right\rangle$$

*Soln.*

$$\begin{aligned}\vec{r} &= \left\langle t, \frac{1}{2}t^2 \right\rangle \\ \vec{r}' &= \langle 1, t \rangle \\ \|\vec{r}'\| &= \sqrt{t^2 + 1}.\end{aligned}$$

so

$$\vec{T} = \frac{\vec{r}'}{\|\vec{r}'\|} = \left\langle \frac{1}{\sqrt{t^2 + 1}}, \frac{t}{\sqrt{t^2 + 1}} \right\rangle$$

Further

$$\begin{aligned}\vec{T}' &= \left\langle \frac{-t}{(t^2 + 1)^{3/2}}, \frac{1}{(t^2 + 1)^{3/2}} \right\rangle \\ \|\vec{T}'\| &= \frac{1}{t^2 + 1}.\end{aligned}$$

so

$$\vec{N} = \frac{\vec{T}'}{\|\vec{T}'\|} = \left\langle \frac{-t}{\sqrt{t^2 + 1}}, \frac{1}{\sqrt{t^2 + 1}}, 0 \right\rangle$$

2. Prove the limits either exist or do not exist. In the former case use the squeeze theorem.

$$(i) \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 + 2y^2}{x^2 + y^2} \qquad (ii) \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y^4}{x^2 + y^2}$$

*Soln.* 2 (i)

$$\text{Along } y = 0, \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 + 2y^2}{x^2 + y^2} = \lim_{(x,y) \rightarrow (0,0)} \frac{x^2}{x^2} = 1$$

$$\text{Along } y = x, \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 + 2y^2}{x^2 + y^2} = \lim_{(x,y) \rightarrow (0,0)} \frac{3x^2}{2x^2} = \frac{3}{2}.$$

Since following different paths lead to different limits, the limit DNE.

*Soln.* 2 (ii) From the inequalities

$$\begin{aligned}-\sqrt{x^2 + y^2} &\leq x \leq \sqrt{x^2 + y^2} \\ -\sqrt{x^2 + y^2} &\leq y \leq \sqrt{x^2 + y^2}\end{aligned}$$

we have

$$\begin{aligned}-(x^2 + y^2) &\leq x^2 \leq (x^2 + y^2) \\ -(x^2 + y^2)^2 &\leq y^4 \leq (x^2 + y^2)^2\end{aligned}$$

which gives

$$-(x^2 + y^2)^3 \leq x^2 y^4 \leq (x^2 + y^2)^3.$$

Thus,

$$-(x^2 + y^2)^2 \leq \frac{x^2 y^4}{x^2 + y^2} \leq (x^2 + y^2)^2$$

and

$$-\lim_{(x,y) \rightarrow (0,0)} (x^2 + y^2)^2 \leq \lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y^4}{x^2 + y^2} \leq \lim_{(x,y) \rightarrow (0,0)} (x^2 + y^2)^2.$$

Since

$$\lim_{(x,y) \rightarrow (0,0)} (x^2 + y^2)^2 = 0$$

by the squeeze theorem

$$\lim_{(x,y) \rightarrow (0,0)} \frac{x^2 y^4}{x^2 + y^2} = 0.$$

3. Find the equation of the tangent plane to the given surface at the specified point

$$x^2 y + xz + yz^2 = 3, \quad P(1, 2, -1)$$

*Soln.* If we define  $F = x^2 y + xz + yz^2 - 3$  then  $F_x = 2xy + z$ ,  $F_y = x^2 + z^2$  and  $F_z = x + 2yz$ . Evaluating these at the point  $P$  gives  $F_x = 3$ ,  $F_y = 2$  and  $F_z = -3$ . The equation of the tangent plane is thus  $3(x - 1) + 2(y - 2) - 3(z + 1) = 0$

4. Find the directional derivative of  $z = x^2 + 3xy + y^2$  at  $(1, 1)$  in the direction of  $\langle -3, 4 \rangle$ .

*Soln.* The gradient is given by  $\nabla z = \langle 2x + 3y, 3x + 2y \rangle$  and at the point  $(1, 1)$  it becomes  $\nabla z = \langle 5, 5 \rangle$ . The direction derivative is then given by

$$\nabla z \cdot \frac{\vec{u}}{\|\vec{u}\|} = \langle 5, 5 \rangle \cdot \frac{\langle -3, 4 \rangle}{5} = \frac{-15 + 20}{5} = 1$$

5. Classify the critical points for

$$z = x^2y - x^2 + y^2 - 18y$$

*Soln.* The derivatives are

$$z_x = 2xy - 2x = 2x(y - 1), \quad z_y = x^2 + 2y - 18.$$

Setting each of these to zero gives the following critical points:  $(0, 9)$ ,  $(-4, 1)$ , and  $(4, 1)$ . The second derivatives are:

$$z_{xx} = 2(y - 1), \quad z_{xy} = 2x, \quad z_{yy} = 2$$

giving  $\Delta = z_{xx}z_{yy} - z_{xy}^2 = 4(y - 1) - 4x^2$ . We now test each critical point

$(0, 9)$	$\Delta = 32 > 0$	$z_{yy} > 0$	min
$(-4, 1)$	$\Delta = -64 < 0$		saddle
$(4, 1)$	$\Delta = -64 < 0$		saddle

6 (i). Find the volume bound by the paraboloid  $z = 1 - x^2 - y^2$  and the plane  $z = 0$

*Soln.* The two surfaces intersect when  $z = 0$  so  $x^2 + y^2 = 1$ . The volume is then obtained from the integral

$$\iint_R (1 - x^2 - y^2) dA$$

As the region of integration is a circle of radius 1, we switch to polar coordinates giving

$$\int_0^{2\pi} \int_0^1 (1 - r^2) r dr d\theta = \frac{\pi}{2}$$

6 (ii). Find the volume inside the sphere  $x^2 + y^2 + z^2 = 2$  and the cylinder  $x^2 + y^2 = 1$

*Soln.* The surfaces intersect when  $z^2 = 1$  or  $z = \pm 1$ . The volume is then obtained from the integral

$$\iint_R 2\sqrt{2 - x^2 - y^2} dA$$

As the region of integration is a circle of radius 1, we switch to polar coordinates giving

$$\int_0^{2\pi} \int_0^1 2\sqrt{2 - r^2} r dr d\theta = \frac{8\sqrt{2} - 4}{3} \pi$$

7. Set of the triple integral  $\iiint f(x, y, z) dV$  in both cylindrical and spherical coordinates for the volume inside the cone  $z = \sqrt{x^2 + y^2}$  and below the plane  $z = 1$ .

*Soln - Cylindrical* Eliminating  $z$  between the equations gives  $x^2 + y^2 = 1$ . This is the region of integration

$$\int_0^{2\pi} \int_0^1 \int_r^1 f(r \cos \theta, r \sin \theta, z) r dz dr d\theta$$

*Soln - Spherical* From the picture we see that  $\phi = 0 \rightarrow \pi/4$ . Further,  $\rho = 0 \rightarrow 1/\cos \phi$  and  $\theta = 0 \rightarrow 2\pi$  so

$$\int_0^{2\pi} \int_0^{\pi/4} \int_0^{\sec \phi} f(\rho \cos \theta \sin \phi, \rho \sin \theta \sin \phi, \rho \cos \phi) \rho^2 \sin \phi d\rho d\phi d\theta$$

8. Is the following vector field conservative?

$$\vec{F} = \langle y^2 + 3yz, 2xy + 3xz, 3xy \rangle.$$

*Soln.* Since  $\nabla \times \vec{F} = 0$  then yes, the vector field is conservative. Thus  $\phi$  exists such that  $\vec{F} = \vec{\nabla} \phi$  so

$$\phi_x = y^2 + 3yz \Rightarrow \phi = x y^2 + 3xyz + A(y, z)$$

$$\phi_y = 2xy + 3xz \Rightarrow \phi = x y^2 + 3xyz + B(x, z)$$

$$\phi_z = 3xy \Rightarrow \phi = 3xyz + C(x, y)$$

Therefore we see that

$$\phi = x y^2 + 3xyz + c$$

and

$$\int_C (y^2 + 3yz) dx + (2xy + 3xz) dy + 3xy dz = x y^2 + 3xyz \Big|_{(0,0,0)}^{(1,2,3)} = 22.$$

9 (i). Evaluate the following line integral  $\int_C 2xy dx + (x+1) dy$  where  $c$  is the counterclockwise direction around the square with vertices  $(0,0)$ ,  $(1,0)$ ,  $(1,1)$  and  $(0,1)$ .

*Soln.* Here we have 4 separate curves which we denote by  $C_1$ ,  $C_2$ ,  $C_3$  and  $C_4$ .

$$C_1 : \text{ Here } y = 0, dy = 0 \text{ so } \int_{C_1} 0 = 0$$

$$C_2 : \text{ Here } x = 1, dx = 0 \text{ so } \int_0^1 2 dy = 2$$

$$C_3 : \text{ Here } y = 1, dy = 0 \text{ so } \int_1^0 2x dx = -1$$

$$C_4 : \text{ Here } x = 0, dx = 0 \text{ so } \int_1^0 dy = -1$$

$$\text{Thus } \int_C 2xy dx + (x+1) dy = 0 + 2 - 1 - 1 = 0.$$

9 (ii). Evaluate the following line integral  $\int_C (x-y) dx + (x+y) dy$  where  $c$  is clockwise direction around the circle of radius 2.

*Soln.* Here we parameterize the curve by  $x = 2 \cos t$ ,  $y = -2 \sin t$ ,  $0 \leq t \leq 2\pi$ . Note the  $-2$  on the  $y$  term as we are going clockwise and not counterclockwise. So  $dx = -2 \sin t dt$  and  $dy = -2 \cos t dt$ . Thus, the line integral becomes

$$\int_0^{2\pi} -(2 \cos t + 2 \sin t) 2 \sin t dt - (2 \cos t - 2 \sin t) 2 \cos t dt = -8\pi$$

10. Green's Theorem is

$$\int_C P dx + Q dy = \iint_R \left( \frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dA.$$

Verify Green's Theorem where  $\vec{F} = \langle 3x^2y, x^3 + x \rangle$  where  $R$  is the region bound by the curves  $y = x^2$  and  $y = x$ .

*Soln.* We have two separate curves which we denote by  $C_1$  and  $C_2$ .

$$C_1 : \text{ Here } y = x^2, dy = 2x dx \text{ so } \int_0^1 3x^4 dx + (x^3 + x)2x dx = 5/3$$

$$C_2 : \text{ Here } y = x, dy = dx \text{ so } \int_1^0 3x^3 dx + (x^3 + x)dx = -3/2$$

so

$$\int_C 3x^2 y dx + (x^3 + x) dy = 5/3 - 3/2 = 1/6.$$

For the second part, since  $P = 3x^2 y$  and  $Q = x^3 + x$  then  $Q_x - P_y = 3x^2 + 1 - 3x^2 = 1$  so

$$\iint_R (Q_x - P_y) dA = \int_0^1 \int_{x^2}^x 1 dy dx = 1/6$$

11 (i). Evaluate  $\iint_S x y dS$  where  $S$  is the surface of the plane  $2x + y + z = 6$ .

*Soln.* Since  $z = 6 - 2x - y$  then  $dS = \sqrt{1 + z_x^2 + z_y^2} dA = \sqrt{1 + 4 + 1} dA$  and thus

$$\int_0^3 \int_0^{6-2x} \sqrt{6} x y dy dx = 27\sqrt{6}/2$$

11 (ii). Evaluate  $\iint_S (x + z) dS$  where  $S$  is the surface of the cylinder  $y^2 + z^2 = 9$  bound between  $x = 0$  and  $x = 4$  in the first octant.

*Soln.* Here, we'll parameterize the surface by  $x = u$ ,  $y = 3 \cos v$  and  $z = 3 \sin v$ ,  $0 \leq u \leq 4$  and  $0 \leq v \leq \pi/2$ . If we let  $\vec{r} = \langle u, 3 \cos v, 3 \sin v \rangle$  then  $\|\vec{r}_u \times \vec{r}_v\| = 3$  and we have

$$\int_0^4 \int_0^{\pi/2} (u + 3 \sin v) 3 dv du = 3(4\pi + 12)$$

12. Verify the divergence theorem

$$\iint_S \vec{F} \cdot \hat{n} dS = \iiint_V \nabla \cdot \vec{F} dV$$

where  $\vec{F} = \langle x + yz, y + xz, z + xy \rangle$  and  $V$  is the volume of the tetrahedron bound by  $x + y + z = 1$  and the planes  $x = 0$ ,  $y = 0$  and  $z = 0$ .

*Soln.* We will first deal with the surface integrals. There are 4 of them.

$S_1$ : Bottom. Here  $z = 0$  so  $\vec{F} = \langle x, y, xy \rangle$  and  $\vec{n} = \langle 0, 0, -1 \rangle$ .

Thus  $\vec{F} \cdot \vec{n} = -xy$  and  $\int_0^1 \int_0^{1-x} -x y \, dy \, dx = -1/24$

$S_2$ : Left. Here  $y = 0$  so  $\vec{F} = \langle x, xz, z \rangle$  and  $\vec{n} = \langle 0, -1, 0 \rangle$ .

Thus  $\vec{F} \cdot \vec{n} = -xz$  and  $\int_0^1 \int_0^{1-x} -x z \, dz \, dx = -1/24$

$S_3$ : Back. Here  $x = 0$  so  $\vec{F} = \langle yz, y, z \rangle$  and  $\vec{n} = \langle -1, 0, 0 \rangle$ .

Thus  $\vec{F} \cdot \vec{n} = -yz$  and  $\int_0^1 \int_0^{1-y} -y z \, dz \, dy = -1/24$

$S_4$ : Plane. Here  $x + y + z = 1$  and  $\vec{n} = \langle 1, 1, 1 \rangle / \sqrt{3}$ .

Thus  $\vec{F} \cdot \hat{n} = (1 + x + y - x^2 - xy - y^2) / \sqrt{3}$  and

$$\int_0^1 \int_0^{1-x} (1 + x + y - x^2 - xy - y^2) \, dy \, dx = 5/8$$

Therefore  $\iint_S \vec{F} \cdot \hat{n} dS = -1/24 - 1/24 - 1/24 + 5/8 = 1/2$ .

Second part.  $\nabla \cdot \vec{F} = 3$  so  $\int_0^1 \int_0^{1-x} \int_0^{1-x-y} 3 \, dz \, dy \, dx = 1/2$ . Verified!
