## Introduction

In the late 1980's, The American Association of Collegiate Registrars and Admissions Officers (AACRAO) created the committee on the Standardization of Postsecondary Education Electronic Data Exchange (SPEEDE) to explore the possibility of exchanging student records electronically. In the early 1990's, the American National Standards Institute (ANSI) Accredited Standards Committee (ASC) X12 approved a suite of national standard transaction sets to allow these exchanges to take place in the education community using the ANSI ASC X12 Electronic Data Interchange (EDI) standards. These standards included an envelope which allowed for multiple types of EDI standard documents to be bundled together, and then sent to another school in a batch.

When the Postsecondary Electronic Standards Council (PESC) approved the newer XML standard for the Student Transcript in 2004, these standards did not include a means for bundling multiple XML instance documents.

For the secondary and higher education communities to achieve the timely, uniform, accurate, and secure exchange of academic records for current or previous secondary and postsecondary students, PESC developed and approved a standard format in eXtensible Markup Language (XML) for an Academic Record Batch Transmission Envelope. This Implementation Guide proposes a format for a Batch Envelope that can contain an unlimited number of Academic Record documents. These documents may derive from several different XML Schemas and do not necessarily reference each other. The documents may typically include secondary and postsecondary transcripts, applications for admission, transcript requests, transcript responses and transcript acknowledgments.

Besides its obvious use for secondary and postsecondary education institutions, this Guide should also be useful for software vendors and state and federal education agencies.

Educational institutions send academic record documents such as high school and postsecondary transcripts to other educational institutions. Although these documents can be sent as single transmissions through various transport protocols, a common method is to utilize a central server set up in a "hub-and-spoke" architecture to act as a clearinghouse for those institutions that are joined together as a unified federation. Several such federations have already been formed at the state, province and national level.

In a federated central server model, it is typical for institutions to send and receive transactions that consist of several different documents in a single batch transmission. However because of the syntax of XML, multiple documents cannot be appended in a single file because the resulting document will not be "well-formed" XML and will be rejected by most parsers. This Academic Record Batch XML Schema provides one solution to that issue.

This Implementation Guide is based on the PESC XML Academic Record Batch Schema version 2.0.0, which in turn, is based on the PESC Core Main schema version 1.4.0 and the Academic Record Sector Library version 1.3.0. The electronic exchange of PESC XML student documents does not require the use of this Batch Schema but it may be specified by certain automated exchange processes. It is recommended that practitioners understand and comply with the requirements outlined in this Guide where its use is specified.

## Purpose of the Academic Record Batch Schema

The Academic Record Batch Envelope serves the following functions:

- a. It allows for the Agency to Agency Feeds on behalf of institution(s) that they are representing. Prior to this version, only first party feeds were negotiated. The implementation of the Batch Envelope allows for 3<sup>rd</sup> party to 3<sup>rd</sup> party feeds which allows an Agency representing an Institution to send to another Agency representing another Institution.
- b. The envelope also defines directions on how the content payload should be handled. Should it be parsed out to individual institutions or sent as one content payload to a receiving Agency/Institution.
- c. The current Record Batch Envelope is optional and not required.

The Academic Record Batch Content serves the following functions:

- a. It allows the concatenation of multiple distinct XML documents into a single document that is itself a valid, well formed, schema validated XML document.
- b. The child documents may each have their separate namespaces which can be validated against their respective schemas. Documents can be a mixture of different academic record types and may be bundled in any order.
- c. No modification to the original child documents is necessary. When extracted from the Batch Content, the documents can stand alone as well-formed, validated XML.
- d. The Batch content is lightweight. It requires a single tag pair around the concatenated documents. There is no requirement for document indexes or addressing information except as originally specified in the child documents.

## Techniques for Use of the Academic Record Batch Schema

**Overview:** This schema was developed for use with a document exchange service, such as the University of Texas at Austin SPEEDE Server. It may be used in other similar services or in other applications that require the use of batch processing of multiple logical XML documents. The following is a description of a typical store-and-forward documents exchange process that illustrates how the batch envelope may be used.

**By the Sender of Original Student Documents:** The sender generates or assembles all XML documents that are intended to be transmitted in a single batch. These documents are concatenated into a single file, without other modification. The entire resulting document is placed within the AcademicRecordBatch XML tag pair and the complete resulting file is stored with the extension .xml. This document is then transmitted to the recipient using a protocol such as sftp, https, etc. The recipient may be the final logical destination of the documents such as another institution or agency, or it may be sent to a document server for additional routing.

**By a Document Exchange Service:** (If used) The XML batch file is received and parsed into individual logical documents. These now multiple XML documents can be further processed according to the specifications of the individual service. For example, these documents may be examined for header information such as destination address and sorted by destination. They may be grouped together with other documents addressed to the same destination that may have come from multiple sources. When the batch of documents is assembled for transmission, they are concatenated into a single file as in the previous step and the resulting document is placed within the AcademicRecordBatch XML tag pair. This single document may then be transmitted.

**Special note:** The exchange service or any other recipient must be aware and be familiar with the type of content being delivered. Generally this means that the exchange service or other recipient has installed all XML schemas that describe any of the received document types. Unfamiliar documents may be rejected as unsupported or impossible to interpret. The list of acceptable document types, schemas and versions may vary by service or recipient. The Academic Record Batch Schema does not specify or restrict the associated schema types that may be transmitted. In theory, any well-formed XML documents may be transmitted in this manner. This Implementation Guide recommends that only PESC-approved XML standard documents be included in the Academic Record Batch document but this is not enforced at the schema level. Users and exchange federations may determine the acceptable use of their service and by extension which documents may be transmitted in this format.

**By Final Receiver of the Original Student Documents:** The XML batch file is received and parsed into individual logical documents. These now multiple XML documents can be further processed according to the specifications of the individual institution or agency.

## **Acknowledgments and Development History**

This schema was developed by the AACRAO SPEEDE Committee in response to a request by the Association of American Medical Colleges (AAMC). AAMC has been receiving the EDI transaction sets for many years and had been used to receiving batches of transcripts enclosed in the EDI Batch Envelope. They insisted on some method of batching XML instance documents in a similar fashion.

The primary leads in the development were Bruce Marton from the University of Texas at Austin and Tuan Anh Do from San Francisco State University.

## AcademicRecordBatch

Tag Name	Schema Use	Description	Recommended Use	Format
BatchEnvelope	Optional	The container that holds all of the identifying information about the parties involved in this exchange of data	Optional	minOcc 0 maxOcc 1
<p><b>Comment:</b> For the transmission of XML instance documents from one school to another, the batch envelope is not required. However, it must be used if there are third party participants in the exchange of the XML instance documents. EDI documents are sent in electronic envelopes (ISA), and it is possible to mail many documents in a single envelope. It is no different with XML. XML incorporates several levels of envelopes in order to insure that each document is correctly identified, and that only like documents are grouped together.</p> <p>This complex data element will be expanded on Page 2.</p>

## **Appendix D – History of Changes Made Since Version 1.0.0 of XML Academic Record Batch Schema**

### **Version 2.0.0**

This version makes it possible for a batch of instance documents to be sent to an intermediary agency acting on behalf of one or more schools or agencies. That agency, in turn, may forward the appropriate instance documents to the intended recipient school or agency.

Version 1.0.0 only contained one data element as child to the root schema. Version 2.0.0 adds two child data elements, one of which is required.

This version is not backwardly compatible with the previous version (1.0.0) and is considered to be a major change to the schema.
