

Setting up your Giant Scales couldn't be easier...

Please discard all transit wood - this is easy to see as it will be marked with an 'X'

Place the **Base** on a flat surface

Slide the **Mid Bar** vertically into the central space within the **Base**

Slide the **Top Bar** through the highest point of the **Mid Bar**

Now add buckets and children and let the learning flow...

On the upper surface of your **Top Bar** you will see 2 pieces of metal sticking up. This forms a unique calibration system which will help your Giant Scales to remain true after the weather makes changes to the wood. Simply transfer the metal washers from one side to the other till the bar balances and then tighten with the wing nuts. This way your scales will always be true.
