Chesapeake Bay Watershed Public Access Plan

January 2013

Prepared by the National Park Service in collaboration with the Commonwealths of Pennsylvania and Virginia, the States of Delaware, Maryland, New York, and West Virginia, and the District of Columbia.

Acknowledgements

This *Chesapeake Bay Watershed Public Access Plan* was prepared in collaboration with a “Public Access Planning Action Team” composed of staff involved in public access planning and implementation at each of the Chesapeake watershed states, the District of Columbia, and the National Park Service. Action Team members involved in developing this plan include:

- John Davy, National Park Service – Chesapeake Bay Office
- Andy Fitch, National Park Service – Chesapeake Bay Office
- Heather Bennett, National Park Service – Chesapeake Bay Office
- Sarah Brzezinski, Chesapeake Research Consortium
- Andrea Almond, Virginia Department of Conservation and Recreation
- Tom Ford, Pennsylvania Department of Conservation and Natural Resources
- Lisa Gutierrez, Maryland Department of Natural Resources
- Larry Hart, Virginia Department of Game and Inland Fisheries
- Mark Hohengasser, New York State Parks
- Jackie Kramer, Pennsylvania Fish and Boat Commission
- Michael Krumrine, Delaware Department of Natural Resources and Environmental Control
- Susan Moerschel, Delaware Department of Natural Resources and Environmental Control
- Danette Poole, Virginia Department of Conservation and Recreation
- Bret Preston, West Virginia Division of Natural Resources
- Tammy Stidham, National Park Service – National Capital Region
- Emily Wilson, Maryland Department of Natural Resources

Hundreds of citizens contributed directly to this plan as well, through public workshops and use of an online tool for suggesting public access sites. In fact, the majority of potential public access sites identified in this plan come directly from suggestions made by citizens.

For more information on this plan, please contact: Superintendent, National Park Service, Chesapeake Bay Office, 410 Severn Avenue, Suite 314, Annapolis MD 21403, (410) 260-2470.

Providing adequate public access to the Bay and its tributaries is important for quality of life, the economy, and for long-term conservation of the region's treasured natural and cultural resources.

Chesapeake Bay Watershed Public Access Plan

January 2013 | National Park Service | Chesapeake Bay Office

Executive Summary

The Chesapeake Bay region is rapidly urbanizing. More than eleven million people live in metropolitan areas close to the Bay, including significant diverse communities and new immigrants. Fewer people interact daily with the waters, forests, and open lands of the region. Despite this trend—or perhaps because of it—regional residents increasingly seek opportunities to reconnect with the outdoors.

State, federal, and local governments are guardians of these opportunities, providing public sites where everyone can enjoy the natural and cultural bounty of the Chesapeake Bay watershed—relaxing, learning, and reflecting in direct interaction with the region's treasured outdoors. Some sites provide direct access to the Bay and its rivers for boating and swimming. Others provide spots where visitors without watercraft can fish, observe wildlife, walk trails, and camp along the water's edge.

Open, green spaces and waterways with ample public access bolster public health and quality of life. People rely on these special places to exercise, relax, and recharge their spirits. Outdoor time strengthens family bonds and nurtures fit, creative children. At the same time, it builds personal connections with the very places that have shaped life in the region for centuries—especially its streams, rivers, and bays. This has a distinct economic value, too, as tourism, much of it associated with the area's waters, is a potent force in the region.

The sense of place that evolves from outdoor experiences along Chesapeake waters often leads to a feeling of shared responsibility for the resources. People who enjoy the outdoors are more likely to become active

NPS/Jett

citizen stewards, engaged in the many conservation and stewardship efforts taking place throughout the region.

Despite this, physical access to the Bay and its tributaries—the very resources that form the basis for the Chesapeake’s unique identity—is limited. This has real consequences for quality of life, for the economy, and for long-term conservation.

The *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* was released in May 2010, in response to Executive Order 13508 (Chesapeake Bay Protection and Restoration) issued by President Obama. It includes a key goal to increase public access to the Bay and its tributaries by adding 300 new public access sites by 2025. The basis for this goal lies in the long-standing public demand for greater access to the water in the Chesapeake region.

The strategy explicitly calls for the National Park Service, in conjunction with the watershed states and other federal agencies, to “develop a public access plan to inform and guide expansion of Chesapeake watershed public access.” Further, the strategy directs the plan to assess the demand for public access; describe (inventory) the existing public access facilities; assess barriers to public access; determine gaps in the public access system; identify opportunities for new access sites; and help direct federal, state, and local funding toward public access opportunities.

This *Chesapeake Bay Watershed Public Access Plan* serves these purposes. The plan was produced in concert with a Public Access Action Team, which includes people involved in public access planning and implementation in each of the Chesapeake watershed states and the District of Columbia. They worked with National Park Service staff, helped guide the planning process, and participated in key decisions with respect to scope and definitions. Team members also served as the primary contacts and reviewers of data as it related to their specific jurisdictions.

This plan reflects public access to significant streams, rivers, and bays in the entire Chesapeake watershed, including portions of Delaware, Maryland, New York, Pennsylvania, Virginia, West Virginia, and all of the District of Columbia. No prior plan for the region has addressed this broad geographic scope.

Specifically, the plan covers all tidal streams and bays with boating opportunities; streams classified as “fifth-order” and higher; and streams smaller than fifth-order when they are part of a water trail or contribute to its development.

Public access sites are locations owned and managed by a public entity (or a nonprofit organization in an agreement with a public entity) providing the following:

- Boat-related access: boat ramps, car-top boat launches, soft launches (supporting paddle craft, motor, and/or sail boats)
- Swimming access: designated areas appropriate for swimming
- Fishing access: piers, bank fishing facilities or easements, and parking adjacent to the water
- Viewing access for water, wildlife, and shoreline areas: nature trails, hiking or biking trails, waterfront trails, boardwalks, and observation decks located at or leading to the water's edge.

Through an extensive process involving review of existing local, state, and federal data, public workshops and an online public mapping tool, this plan describes the status of existing public access as follows:

- There are 1,150 documented existing public access sites where people can launch boats, fish, swim, or look out over the Bay and its tributaries. About a third of these sites provide more than one types of access.
- The number of access sites is very low in comparison to the amount of shoreline in the Chesapeake watershed. There are just 770 existing access sites along the shorelines of the Bay and tidal portions of its tributaries, a combined length of 11,684 miles—equivalent to the distance along the United States' west coast from Mexico to Canada.
- Multiple studies and plans, including all state outdoor recreation plans, continue to document high public demand for access to streams, rivers, and bays.
- Significant stretches of shoreline have little or no access. In some cases, the gap between sites is dozens of miles. For example, the southern bank of the tidal James River includes a 64-mile stretch with no regularly open access sites. And there are long stretches of the Rappahannock, Potomac, Susquehanna, Nanticoke and other rivers, as well as the shoreline of the Bay where the public has little or no access to the water. Long, inaccessible stretches make it difficult to plan trips along water trails and reduce the benefits of ecotourism. A lack of public access also leads to trespassing, as users have no other option for getting on or off the water.

NPS/Spielmann

- Less than half of access sites provide launches or landings for boats or paddle craft.
- State agencies report significant overcrowding at trailerable boat launching facilities along the Bay and tidal tributaries.

To identify potential new public access sites, the planning team reviewed existing planning documents to identify and assess all previously proposed potential sites, and members of the public identified hundreds of additional desired sites at workshops and online. The team reviewed and refined the list of these sites for this plan. This revealed that:

- 320 specific potential new sites have been identified for providing public access to the water.
- Over half of these sites are already on publicly owned land.
- Only a small fraction of these sites (5 percent) are categorized as “construction-ready.” The remainder requires either additional design and permitting or more substantial evaluation.
- Boat launching capacity is the most frequently suggested access type for these sites (47 percent of the total sites).
- The highest demand for new public access sites is frequently but not exclusively concentrated in and around urban areas.
- A large number of potential sites are along existing water trails or national historic trails, which can often bring strong community and local support for developing needed sites.
- Members of the paddling public frequently expressed a desire for small primitive campsites, picnic areas, and restrooms at appropriate locations along water trails.

NPS

The plan recognizes and documents a series of planning and policy considerations that will influence a strategic approach to expanding public access. In addition, the plan sets out a series of actions for moving access development forward. These include:

1. Make funding for public access a priority.
2. Carry out and support more detailed assessments and project design for potential sites.
3. Fill strategic gaps in access along water trails.
4. Incorporate identified proposed public access sites and actions in key plans.
5. Further examine urban public access issues and needs.
6. Work with private sector funders to develop access.

7. Engage in hydropower re-licensing processes to expand public access.
8. Explore options for resolving railroad crossing liability.
9. Establish memoranda of understanding (MOUs) with transportation departments.
10. Explore potential for additional access on public lands.
11. Fully address accessibility at public access sites.
12. Build opportunities for citizen stewardship.

Implementing these actions and responding to the specific opportunities for adding access sites will expand the number of places for people to get to the water by more than 20 percent by 2025.

Ultimately, this undertaking is not just about adding more boat launches or fishing piers. It is about extending the scope and range of access to the water to greater and greater reaches. Citizens of the region want more places along the water where they can walk, sit, play, picnic, camp, swim, fish, watch wildlife, and put in their canoes, kayaks, paddleboards, sailboats, and powerboats. Public access to the Chesapeake Bay and its tributaries is important to their quality of life.

(Intentionally blank for two-sided printing.)

An Executive Order from President Obama triggered this plan to add 300 new public access sites to the Chesapeake Bay watershed by 2025.

I. Introduction

The *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* was released in May 2010, in response to Executive Order 13508 (Chesapeake Bay Protection and Restoration) issued by President Obama.¹ This strategy includes a key goal to “Conserve Land and Increase Public Access.” Specifically, the strategy aims to increase public access to the Bay and its tributaries by adding 300 new public access sites by 2025. The basis for this goal lies in the long-standing public demand for greater access to the water in the Chesapeake region.

The *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* explicitly calls for the National Park Service, in conjunction with the watershed states and other federal agencies, to “develop a public access plan to inform and guide expansion of Chesapeake watershed public access.” Further, the strategy calls for the plan to assess the demand for public access; describe (inventory) the existing public access facilities; assess barriers to public access; determine gaps in the public access system; identify opportunities for new access sites; and help direct federal, state, and local funding toward public access opportunities.

This *Chesapeake Bay Watershed Public Access Plan* serves these purposes. It was produced in concert with a Public Access Action Team, which includes people who are involved in public access planning and implementation in each of the Chesapeake watershed states and the District of Columbia. They worked with National Park Service staff on many aspects of the effort, helped guide the planning process, and participated in key decisions with respect to scope and definitions. Team members also served as the primary contacts and reviewers of data as it related to their jurisdictions.

Over the following pages, the plan is organized to:

- Summarize the demand for public access in the watershed.

NPS/Rogers

- Outline the process, steps, and definitions used for this plan.
- Establish the baseline of existing public access sites.
- Depict specific potential public access sites that could be developed in the future, as well as areas and stretches requiring additional attention.
- Describe planning challenges to be considered in adding new access sites.
- Summarize findings and set out next steps for implementing the plan and increasing access.

NPS

The six Chesapeake watershed states and the District of Columbia have all noted a high need for additional public access opportunities.

II. The Demand for Public Access

Executive Order and America's Great Outdoors Report

The Chesapeake Bay region is rapidly urbanizing. More than eleven million people live in metropolitan areas close to the Bay, including significant diverse communities and new immigrants. Fewer people interact daily with the waters, forests, and open lands of the region. Despite this trend—or perhaps because of it—regional residents increasingly seek opportunities to reconnect with the outdoors.

State, federal, and local governments are guardians of these opportunities, providing public sites where everyone can enjoy the natural and cultural bounty of the Chesapeake Bay watershed—relaxing, learning, and reflecting in direct interaction with the region's treasured outdoors. Some sites provide direct access to the Bay and its rivers for boating and swimming. Others provide spots where visitors without watercraft can fish, observe wildlife, walk trails, and camp along the water's edge.

Open, green spaces and waterways with ample public access bolster public health and overall quality of life. People rely on these special places to exercise, relax, and recharge their spirits. Outdoor time strengthens family bonds and nurtures fit, creative children. At the same time, it builds personal connections with the places that have shaped life in the region for centuries—especially its streams, rivers, and bays. This has a distinct economic value, too, as tourism, much of it associated with the area's waters, is a potent force in the region.

The sense of place that evolves from outdoor experiences along Chesapeake waters often leads to a feeling of shared responsibility for these resources. As a result, people who enjoy the outdoors are more likely to

NPS/Rogers

NPS/Jett

become citizen stewards, engaged in the many conservation and stewardship efforts taking place throughout the region. Since a core Chesapeake restoration goal is to make the Bay and its tributaries “fishable and swimmable,” then public access to the water is both an end goal and a way to get there.

Despite this, the *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* clearly states that physical access to the Bay and its tributaries—the very resources that formed the basis for the Chesapeake’s unique identity—is limited. This has real consequences for quality of life, for the economy, and for long-term conservation.

Americans’ demand for access to water is echoed in the *America’s Great Outdoors* (AGO) report.² AGO listening session participants expressed strong support for their waterways and better access to water-based recreation. This resulted in a goal in the AGO report to “Empower communities to connect with America’s great outdoors through their rivers and other waterways.” Recommendations under this goal include establishing a national blueway trails initiative and facilitating recreational access to waterways. The report notes that many people cannot access their local water bodies due to physical barriers, unsafe conditions, or lack of awareness as to what may be close at hand. The *America’s Great Outdoors Fifty-State Report*, which outlines two specific actions to enhance people’s outdoor connections in each of the 50 states and the District of Columbia, has at least one action involving the enhancement of public water access in Pennsylvania, Maryland, Virginia, and the District of Columbia.³ Thus again, a strong need has been demonstrated to enhance public access opportunities for all segments of the population.

Demand and Need at the State and Local Levels

The six Chesapeake watershed states and the District of Columbia have all noted a high need for additional access in their State-wide Comprehensive Outdoor Recreation Plans (SCORPS), public access plans, and boating infrastructure plans. In Virginia’s current SCORP, for example, the highest ranked outdoor recreation need is for better public access to the state’s waters.⁴ Throughout the six-state Bay region, water-based recreation—including fishing, all types of boating, swimming, and beach use—are among the top twelve activities based on the percent of the population participating in each activity. Wildlife observation and enjoying a water-related view from observation decks or the water’s edge are also highly desirable. Economically, this is demonstrated by the higher

fees users are willing to pay in some state park systems for campsites and cabins with water frontage. Picnic shelters, cabins, and campsites located on the water are the ones most requested and usually reserved first.

In the major tidal portions of the Bay region, there is major demand for additional boat ramps to handle trailered water craft. Many existing sites cannot handle the use they receive on summer weekends. This creates conflicts between users and also with site neighbors, as people park their cars and trailers along nearby roads once the parking area at the launch ramp is full.

Another indication of the demand for new access sites is the growing popularity of water trails. Pennsylvania's SCORP, for example, shows that 45 percent of the people surveyed said there was a need for more water trails—not surprising, since participation in paddle sports has grown significantly over the past decade and is expected to continue.⁵ The Outdoor Foundation's *2011 Outdoor Recreation Participation Report* showed that participation in kayaking, paddle-boarding, and windsurfing increased by 33 percent in just the past year.⁶ In the Chesapeake watershed, a 2011 survey in Virginia found that canoeing and kayaking increased by over 70 percent in the last five years.⁷ In all six states in the Bay watershed and in the District of Columbia, numerous local agencies and organizations have worked with state and federal partners to develop new water trails. Today, there are more than 3,200 miles of water trails in the Chesapeake region. Many new trails are under consideration. Additional public access sites are needed to support these trails, as well as those yet to be developed.

The demand for new access sites was clearly and consistently demonstrated during the public input meetings held for the development of this plan. On the average, participants identified over 25 needed access sites at each of the four workshops held in the Bay region. Additionally, an online survey received approximately 10,000 views during the month the survey was in process and the public submitted hundreds of potential new access sites on waterways throughout the study area.

Economic Benefit

According to the 2006 study *The Active Outdoor Recreation Economy*, paddle-based recreation and fishing alone have a total national economic value of \$97.5 billion.⁸ The 2011 report, *The Economics Associated with Outdoor Recreation, Natural Resources Conservation, and Historic Preservation in the United States*, found that recreational power boating generated \$32.5 billion in

NPS/Jett

sales and services.⁹ Power boating, particularly on the Bay and its major tributaries, contributes about \$5 billion to the area's economy. Clearly, water-based recreational activities make important economic contributions to states and localities across the Bay region. This drives the high demand and need to not only maintain what exists but also provide new access and support facilities for water-based recreation.

James River Association

In addition to the ongoing need to develop new and maintain existing ramps and trailer parking for powered craft, a number of communities are also developing and promoting water trails as a part of their eco-tourism initiatives. The development of appropriate access both up and downstream from these “trail towns” is important to their success. Depending on the size of the waterway, these trails can include facilities to support paddle craft, trailerable power boats, or even larger cruising vessels. Each community promotes their trail and support amenities in an effort to attract tourism dollars. Partnerships are developed with state agencies, local governments, non-profits, outfitters, and the food and lodging industry.

Success stories in this regard include the Mathews County Blueways, which has developed a series of water trails in the county and support services for visitors. Another example is the Susquehanna Greenway Partnership, which has just begun the Susquehanna River Towns Program. The program will provide technical assistance to towns along the Susquehanna River to develop events, ordinances that preserve the riparian corridor along the river, and partnerships within the community to promote tourism. Delaware is developing and promoting the Nanticoke River Water Trail by working in partnership with Sussex County Tourism; the towns of Seaford, Blades, Laurel, and Bethel; and several non-profit groups such as the Nanticoke River Watershed Alliance.

Communities throughout the region are undertaking activities to meet residents' needs and boost tourism. For some, the emphasis may be on upgrading and/or maintaining their infrastructure to support both power and sail craft for popular traditional activities such as fishing or cruising. Others may be developing water trail projects and support facilities. Some are undertaking efforts to add or improve public parks along the water to support a variety of activities. No matter the path, success depends on the provision and maintenance of adequate public access and the services to support it.

Connecting Families with Nature

Providing public access to the region's waterways can play a key role in connecting people, especially families, with our natural world. This is becoming more and more important as trends show that Americans are spending an average of 90 percent of their time indoors. Outdoor experiences have become particularly critical for children, who typically spend over 7.5 hours each day (53 hours each week) using electronic entertainment.¹⁰ This contributes to an increase in obesity and associated health problems, not to mention a loss in social and interpersonal skills.

New studies are showing that interaction with nature is important to personal development and human health. It cannot be replaced with indoor electronic gaming. New evidence gained from workplace, education, health, and childhood development studies is revealing that interaction with our natural world is far more important to sound development than some had previously thought. Access to public waters throughout the Bay region could help reconnect families with their natural world and all of the associated benefits that outdoor activities can bring.

(Intentionally blank for two-sided printing.)

NPS/Spielmann

More than 150 of the potential new access sites listed in this plan were suggested by members of the public.

III. Planning Process and Parameters

Geographic Area

This plan reflects public access to significant streams, rivers, and bays in the entire Chesapeake watershed, including portions of Delaware, Maryland, New York, Pennsylvania, Virginia, West Virginia, and all of the District of Columbia. No prior plan for the region has addressed this geographic scope. Past efforts under the Chesapeake Bay Program limited the inventory and tracking of public access sites to the Chesapeake Bay, its major tidal tributaries up to the fall line, and the mainstem of the Susquehanna River in Pennsylvania.

This plan uses a uniform definition of the water bodies covered by the plan to ensure a consistent planning process and facilitate future tracking efforts. There are three elements to this.

First, consistent with the past public access planning efforts of the Chesapeake Bay Program, all tidal streams and bays with boating opportunities are included in the planning area.

Second, the plan covers “fifth-order streams” and higher, as shown on [the map](#) on page 10. Stream order is a system for classifying streams and rivers based on a scale of 1 to 12, with first-order streams being the smallest and twelfth-order the largest. Typically, first- through third-order streams are small headwater tributaries. The Amazon, largest river in the world, is a twelfth-order stream. Within the Chesapeake watershed, the lower Susquehanna and lower Potomac are seventh-order streams; the Shenandoah River, a tributary of the Potomac, is a sixth-order stream; the York River is also a sixth-order stream, while one of its tributaries, the Pamunkey River, is a fifth-order stream. Fifth-order streams are large enough to offer canoe/kayak use during at least some part of the year.

Chesapeake Bay Program

Chesapeake Bay Watershed Public Access: Tidal Shoreline and Streams of Fifth Order or Higher

Finally, at the discretion of state planning staff, access sites can be considered on streams smaller than fifth-order when such streams are part of a water trail or contribute to its development.

Definition of Public Access and Types of Access Development

This plan recognizes that ownership and management responsibility of a public access site are key factors in planning for and funding public access development. Maintaining an accurate inventory of open, available public access sites—and their associated amenities—is a critical component for planning, marketing, and funding. For this reason, and to make a clear distinction between sites in the public estate versus those operated by others, public access sites are defined as those sites owned, operated, and/or managed expressly for a type of public access by:

1. Any unit of federal, state, or local government; or
2. A non-governmental organization operating under an agreement with a governmental agency.

Informal sites—those that may be on public land and used by the public but which are not managed by an agency for access—are not counted as public access sites. To be counted, a site must be developed and expressly managed for a type of public access.

The types of access included in this plan are as follows:

- Boat-related access: boat ramps, car-top boat launches, soft launches (supporting paddle craft, motor, and/or sail boats)
- Swimming access: designated areas appropriate for swimming
- Fishing access: piers, bank fishing facilities or easements, and parking adjacent to the water
- Viewing access for water, wildlife, and shoreline areas: nature trails, hiking or biking trails, waterfront trails, boardwalks, and observation decks located at or leading to the water's edge.

Definition of New Public Access

For the purposes of this planning effort and future tracking, the following will be considered new public access sites that count towards the goal of developing 300 new sites by 2025:

NPS/Spielmann

NPS/Jett

- Development of a new public access facility on a site owned and operated by a governmental entity or non-governmental organization operating under an agreement with an entity of government
- Development of a new type of access at an existing site, such as a fishing pier added to a site that currently has a boat ramp

If an informal site becomes officially recognized and managed by a public agency, it would then be counted as a new public access site.

Certain enhancements to existing public access are not counted as new access. For example, adding new parking, a restroom, picnic area, or other amenity to an existing site does not equate to a “new” site. To be counted as a new access site, a new type of access must be added to the existing site.

Establishing the Baseline of Existing Access Sites

Developing the new baseline of existing access sites involved two steps:

1. *Analysis by state and federal agencies:* Participating agencies were provided with a spreadsheet showing a preliminary inventory of access sites along with a map of the study area showing fifth-order streams and higher. Sites were inventoried based on the four types of access used in this plan (boating access, fishing access, swimming access, and viewing access). The agency partners checked data on file and updated the spreadsheet and map with all existing sites that were missing from the list.
2. *Public additions:* During a public involvement process (described below), participants were asked in workshops and through an on-line tool to review the existing site maps and spreadsheets and to identify any existing sites that had been missed. Participating state and federal agencies reviewed these additions to ensure accuracy.

Data from these steps were used to establish and describe the new baseline of existing access sites, discussed in appendix A.

Public Involvement in Identifying Access Sites

An extensive effort was made to ask members of the public where access is needed, as well as to probe their knowledge of existing sites. This process was handled in two ways. First, four public meetings took place in key urban areas, including Baltimore, Maryland; Richmond, Virginia;

Harrisburg, Pennsylvania; and Washington, D.C. At each of these meetings, the public was invited to note on maps locations where new access was desired. This process resulted in the identification of over 100 potential access sites.

Second, a new web-based tool was developed to allow anyone with Internet access to identify the location of a potential access site and list the type(s) of access desired at that site. This tool was active for one month, receiving over 10,000 hits and suggestions for more than 400 potential access sites. This innovation in obtaining public feedback allowed for a much broader range of public participation and demonstrated strong public interest in water access.

(Intentionally blank for two-sided printing.)

NPS/Rogers

The combined shoreline of the Bay and its tidal tributaries totals 11,684 miles—equivalent to the distance along the United States' west coast from Mexico to Canada.

IV. Current Status of Public Access in the Chesapeake Watershed

This section illustrates the following major points:

- There are 1,150 documented existing public access sites where people can launch boats, fish, swim, or look out over the Bay and its tributaries.
- On average, sites are about 15 miles apart, creating significant stretches of shoreline with no access. In some cases, the gap between sites is dozens of miles.
- About one-third of the sites provide multiple types of access.
- Less than half of the sites provide launches or landings for boats or paddle craft.

This plan documents 1,150 existing public access sites in the Chesapeake watershed as of September 2011, making it the most extensive inventory to date of current public access sites in the region.¹¹ That said, some existing sites managed by local governments have likely escaped documentation through this process. As these sites are identified in the future, they will be added to the inventory as previously existing sites.

[The map](#) on page 17 shows the location of all existing public access sites documented through this inventory (see also table 1).

A total of 1,150 public access sites might seem like a reasonable number for the area. In the context of a 64,000 square-mile watershed with 17 million residents, however, this is not the case.

- While there are 770 existing access sites along the shorelines of the Chesapeake Bay and the tidal portions of its tributaries, this combined tidal shoreline totals 11,684 miles—equivalent

NPS/Rogers

to the distance along the United States’ west coast from Mexico to Canada.

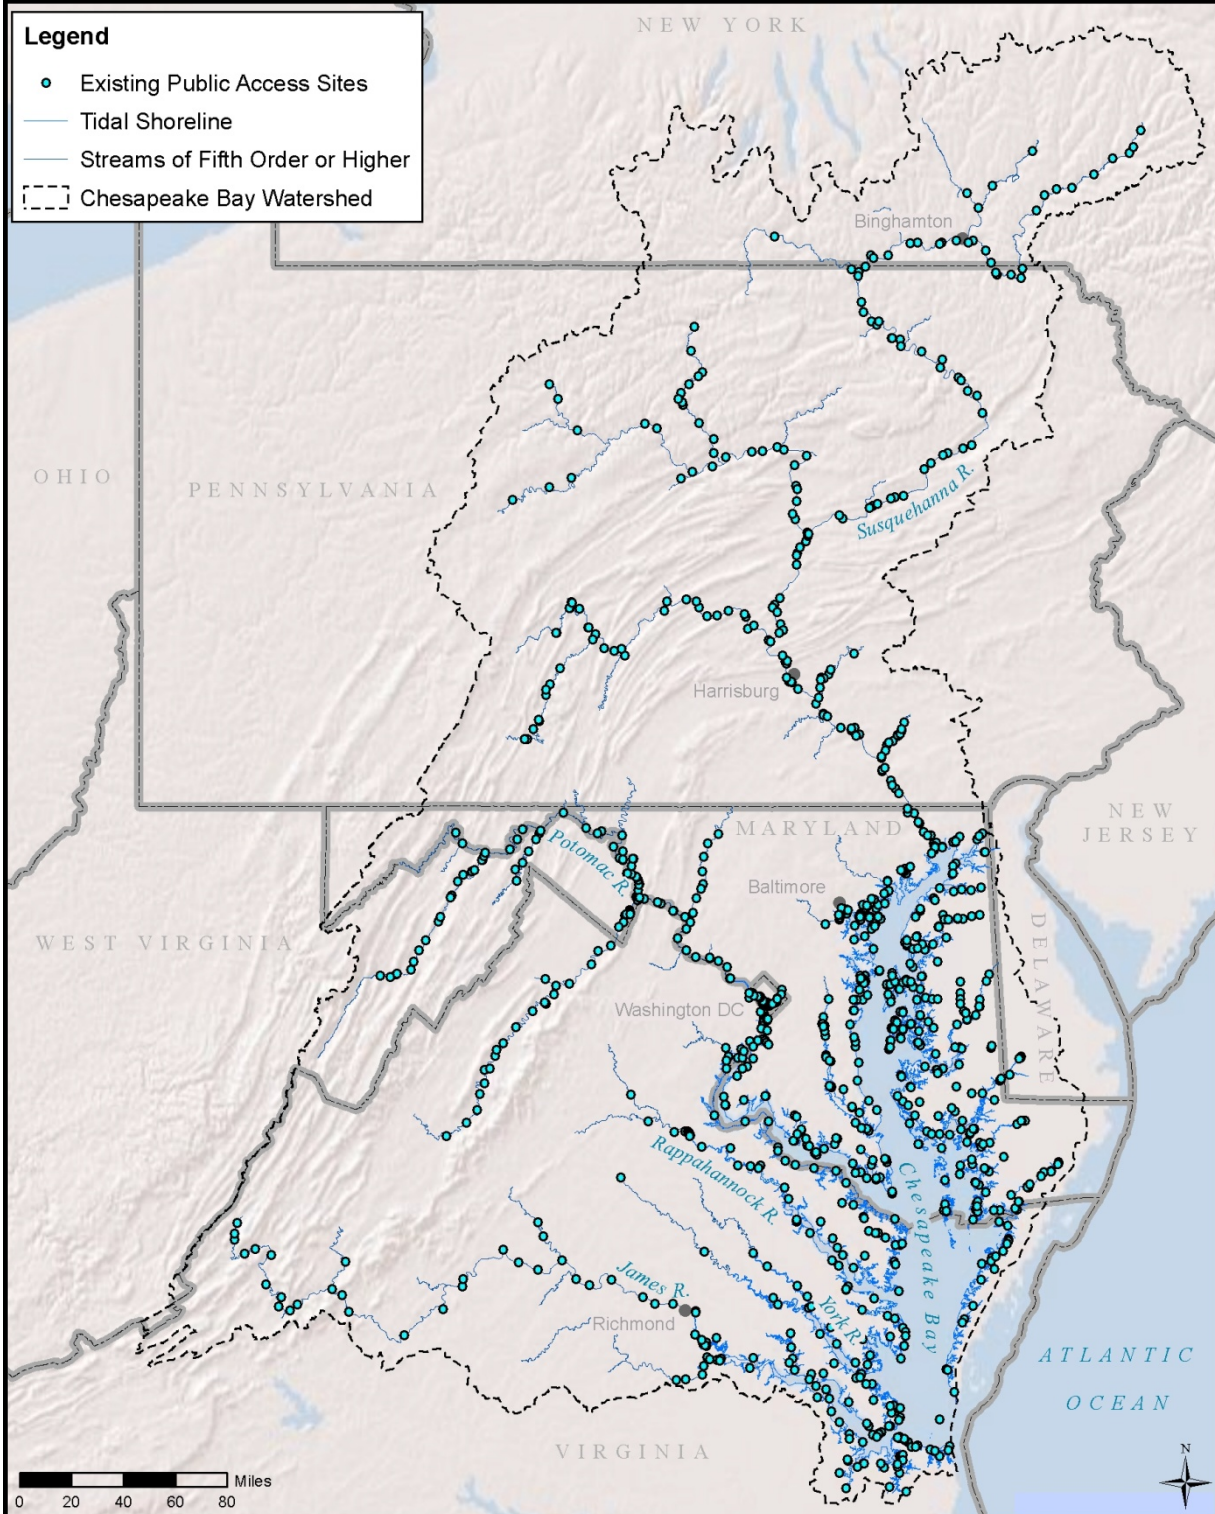

- The average distance between public access sites along the tidal shoreline is over 15 miles. In many cases it is much higher: along the southern bank of Virginia’s James River, between City Point Park in Hopewell and Chippokes State Park, there are no regularly open public access sites in a span of approximately 64 miles.
- Along the east bank of the Susquehanna River, between the confluence of the West Branch and the town of Tunkhannock, there are only two sites along 96 miles of riverbank, resulting in an average distance of 32 miles between sites.
- For those who wish to launch boats, the travel distance between access sites can be even more extreme, as only 43 percent of existing access sites provides facilities for putting boats, canoes, or kayaks into the water.

It is difficult to visualize gaps between public access sites on a watershed-wide scale when long distances are compressed to fit on a page. [The map](#) on page 18 offers one representation of the distribution of access sites. It depicts the *average* distance between access sites along the riverbank or shoreline of river segments and the Bay.¹²

Chesapeake Bay Watershed Public Access: Existing Public Access Sites

Chesapeake Bay Watershed Public Access: Average Length of Shoreline or Riverbank Between Existing Sites

It is important to remember that actual distances between sites vary and the actual length of the shoreline is greater than it might appear.

Approximately 91 percent of the existing public access sites are located in Maryland, Pennsylvania, and Virginia. This is not surprising since these states make up about 85 percent of the land mass in the study area.

The highest density of existing public access sites is generally around the major population centers of these states that have reasonable proximity to water resources. The densest concentrations of existing access sites are around Baltimore and Annapolis, Maryland; in the Washington, D.C./ Alexandria, Virginia area; the Hampton-Norfolk area; and around Harrisburg, Pennsylvania. For example, a city effort to establish “street-end parks” at the water is one reason why Spa Creek in Annapolis, Maryland, has 17 sites along 7.5 miles of shoreline—an average of one site every four-tenths of a mile.

About one third of existing public access sites throughout the Chesapeake watershed offer multiple types of recreational experiences (fig. 1). Specifically, 303 of the 1,150 existing public access sites offer two types of access, 95 sites offer three types of access, and five sites offer all four types of recreational access. The remaining 747 sites offer a single type of recreational access.

There are 699 existing public access sites that offer boating access (42 percent of total sites), 614 sites that offer fishing access, 267 sites that offer viewing access, and 78 sites that offer swimming access (fig. 2). It is worth noting that viewing and swimming occur at many sites not specifically designed for these uses.

(Intentionally blank for two-sided printing.)

NPS/Jett

This plan identified 320 potential access opportunities in the Bay region, and the list will be regularly updated with new suggestions.

V. Potential Public Access Sites in the Chesapeake Bay Watershed

This section describes potential locations for new public access sites in the Chesapeake Bay watershed. It illustrates the following points:

- Over 300 specific potential new sites have been identified for providing public access to the water, based on public input and local, state, and federal agency planning documents.
- Over half of these sites are already on publicly owned land.
- Only a small fraction of these sites (5 percent) are categorized as “construction-ready.” The remainder requires either additional design and permitting or more substantial evaluation.
- Boat launching capacity is the most frequently suggested access type for these sites (47 percent of the recreation suggestions).

Identification of the potential public access sites occurred through three major steps:

1. *Assessment of state plans:* State members of the Public Access Action Team reviewed existing planning documents to identify and assess all previously proposed potential public access sites.
2. *Public identification of desired access:* Members of the public identified hundreds of desired access sites during the public outreach portion of this effort. They also indicated many stretches of shoreline or riverbank where access is desired, but without suggesting specific locations for new sites.

Over 500 potential access sites were identified through the steps above.

PA DCNR

3. *Action Team review:* The Public Access Action Team refined the list of potential sites by carefully reviewing all of the submitted information. In some instances, the same site was recommended several times by different sources. In other cases, a recommended site already existed and was moved to the inventory of existing sites if it had not already been captured. Some sites had already been investigated and found unsuitable; others were submitted without enough information to adequately identify them, and they were deleted from the list.

The full process resulted in a final list of 320 potential access opportunities in the Bay region. However, the identification of potential access sites is not a closed or static process. New opportunities for access will continue to be identified over time by citizens, non-governmental organizations, and local, state, and federal government. These will be incorporated in future updates to the data supporting this plan.

Table 2: Existing & Potential Public Access Sites		
Jurisdiction	Existing	Potential
District of Columbia	23	4
Delaware	6	6
Maryland	578	103
New York	26	1
Pennsylvania	183	88
Virginia	290	118
West Virginia	44	0
Total	1,150	320

Grouping Potential Sites by Readiness

This plan groups potential access sites by readiness for development:

- Category 1 - Sites that are essentially ready for construction, with planning and permitting generally complete
- Category 2 – Sites that still require some additional planning and review before they could be developed
- Category 3 – Sites that need substantial analysis and planning before they could be developed

Public access is often opportunistic and a site not identified in the plan could become available, generate support, and move to a category 1. Also, a category 3 site could be more critical for access than a category 1 site; if the support and funding materializes it could become a priority. Potential sites identified in the future will be added to the plan in the appropriate category.

In short, this plan groups sites based on how quickly they could be developed if funding were made available. *This plan could not and does not rank sites from lowest to highest priority.*

[The map](#) on page 24 depicts the potential public access sites by category. A table listing each potential site is in appendix B.

NPS

Analysis of Potential Access Sites

Of the 320 potential public access sites identified in this plan, 38 percent were identified from prior local, state, and federal agency planning processes; the remaining 62 percent were suggested by the public.

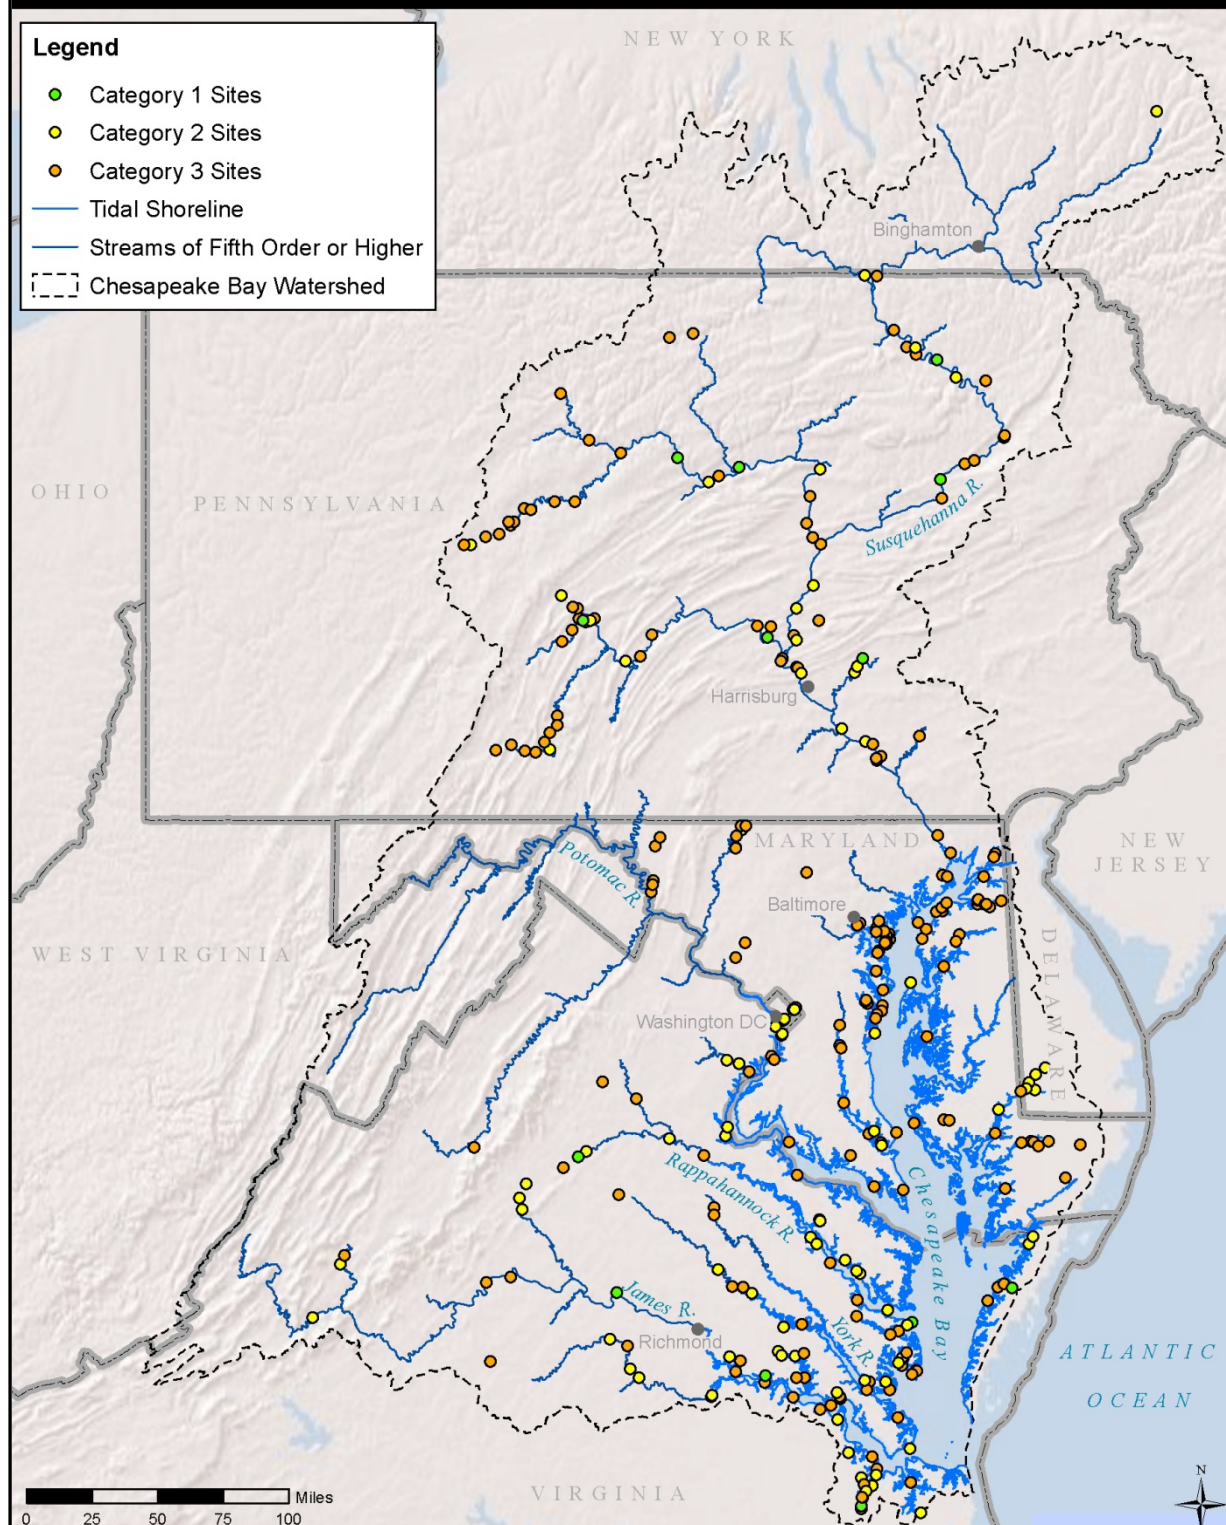

Of the potential sites, approximately 97 percent (309 sites) are located in Maryland, Pennsylvania, and Virginia. These states have the largest land mass in the watershed. Six potential sites were identified in Delaware, four in the District of Columbia, and one in New York. None were identified in West Virginia (see table 2).

Not surprisingly, the majority of potential sites require significant additional investigation before any development could proceed; as a result, 66 percent of the potential sites were placed in category 3. Twenty-nine percent falls into category 2, which consists of sites that need some additional planning and permit review before they could be developed.

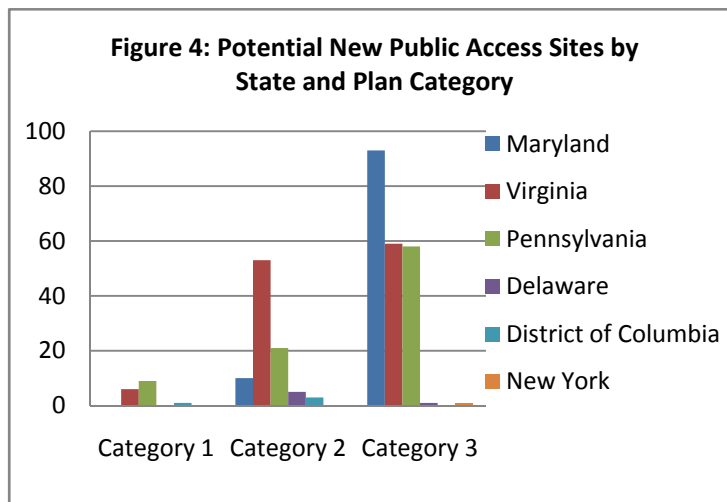

At the time this plan was developed, only 5 percent of the potential sites were nearly “construction-ready” and placed in category 1 (fig. 3).

Chesapeake Bay Watershed Public Access: Potential Public Access Sites

There were nine in Pennsylvania, six in Virginia, and one in the District of Columbia (fig. 4).

Approximately 57 percent of the potential sites had more than one type of recreational access suggested. At approximately 30 percent of the sites, two types of recreational use were proposed. At 23 percent of the sites, three types of recreation were proposed. At 4 percent of the sites, all four types of recreational usage were proposed. A single recreational use was proposed for approximately 43 percent of the potential new public access sites (fig. 5).

While there were often multiple types of recreational uses suggested for a site, some uses were recommended more than others. Throughout the watershed, boating access was the most frequently suggested recreation type (47 percent) followed by fishing (27 percent), viewing (22 percent), and swimming (4 percent) (fig. 6).

Watershed-wide, boating access was also the most “construction-ready” recreation type, accounting for just over half of both the category 1 and category 2 sites. Swimming access was consistently the least proposed recreational use and had the fewest number of category 1 sites (fig. 7).

Ten percent of the proposed sites are on land owned by federal agencies; 13 percent on land owned by state agencies; 30 percent on locally owned land; and 18 percent on privately held land. For the remaining 29 percent of the potential sites, the land ownership has yet to be determined. These sites were suggested by members of the public who couldn't identify the property owners but believed they would make good access locations (fig. 8).

Final ownership cannot be determined without evaluating detailed parcel information, which is beyond the scope of this plan. Most sites are likely privately owned; however, a sizeable number may be located in public rights of way near roads and bridges. These ownership patterns suggest that the majority of new public access site development, in the near term, will likely take place at the local level, though funding will likely be leveraged through federal, state, and private sources.

Geographic Areas with a High Interest in Public Access

The map on page 29 illustrates the concentrations of potential public access sites. The warmer colors indicate a high concentration of proposed sites. Geographic areas that received a high number of site suggestions include:

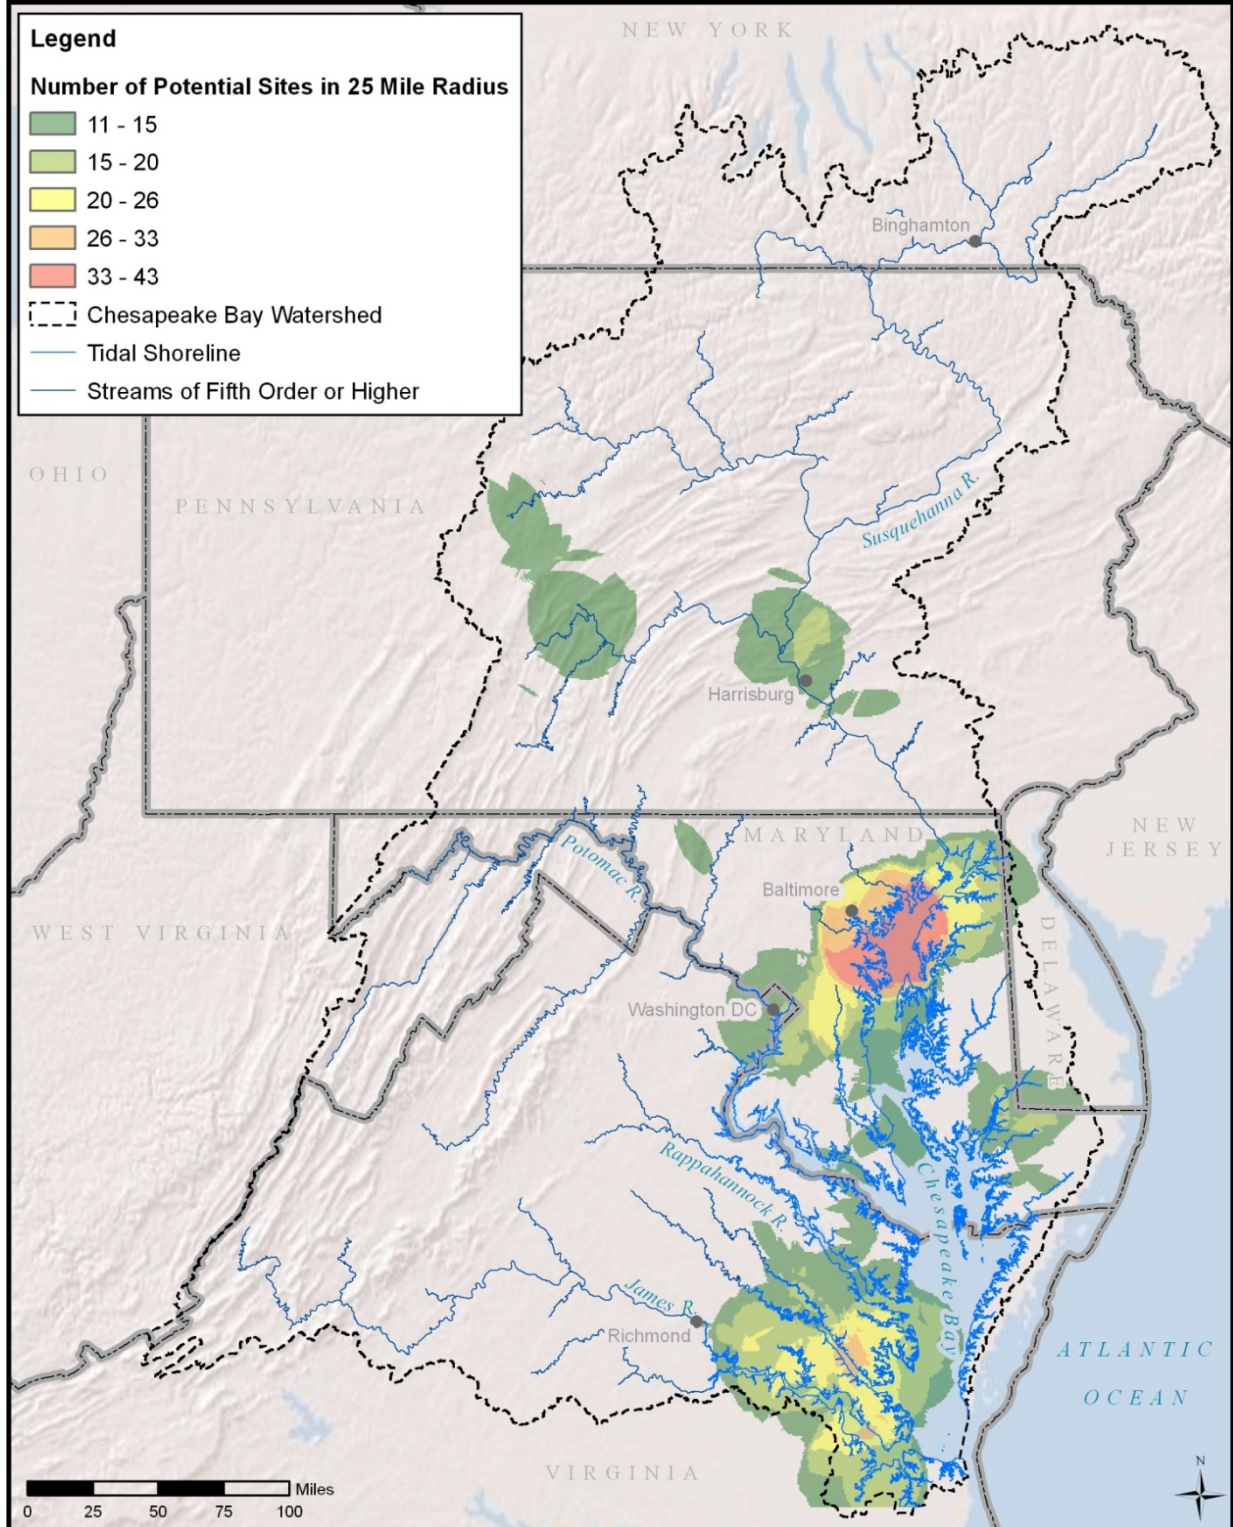

1. Dundalk/Edgemere area of Baltimore County, Maryland
2. Annapolis, Maryland
3. Along the Sassafras River and main stem of the Chesapeake Bay south of the Sassafras River, Maryland
4. Area surrounding the Nanticoke River in Delaware and Maryland

5. Anacostia and Potomac Rivers in Washington, DC, and Arlington, Virginia
6. Fort Monroe in Hampton, Virginia
7. Colonial National Historic Park Area, Virginia
8. Along the Nansemond River, Virginia
9. Harrisburg, Pennsylvania
10. Raystown Branch of the Juniata River, Pennsylvania
11. Area surrounding Altoona, Pennsylvania

The shoreline areas surrounding Baltimore County and Annapolis, Maryland, received the highest density of public access site suggestions in the Chesapeake watershed.

The highest demand for new public access sites is frequently but not exclusively concentrated around urban centers, as the map on page 29 and the list above shows. With their close proximity to major cities, the development of new public access sites in these areas could provide increased public access for a large, diverse population. Providing urban residents with public access to waterways is also a federal priority that has been called out in the Urban Waters initiative, *America's Great Outdoors* report, and the National Park Service's *A Call to Action*.¹³

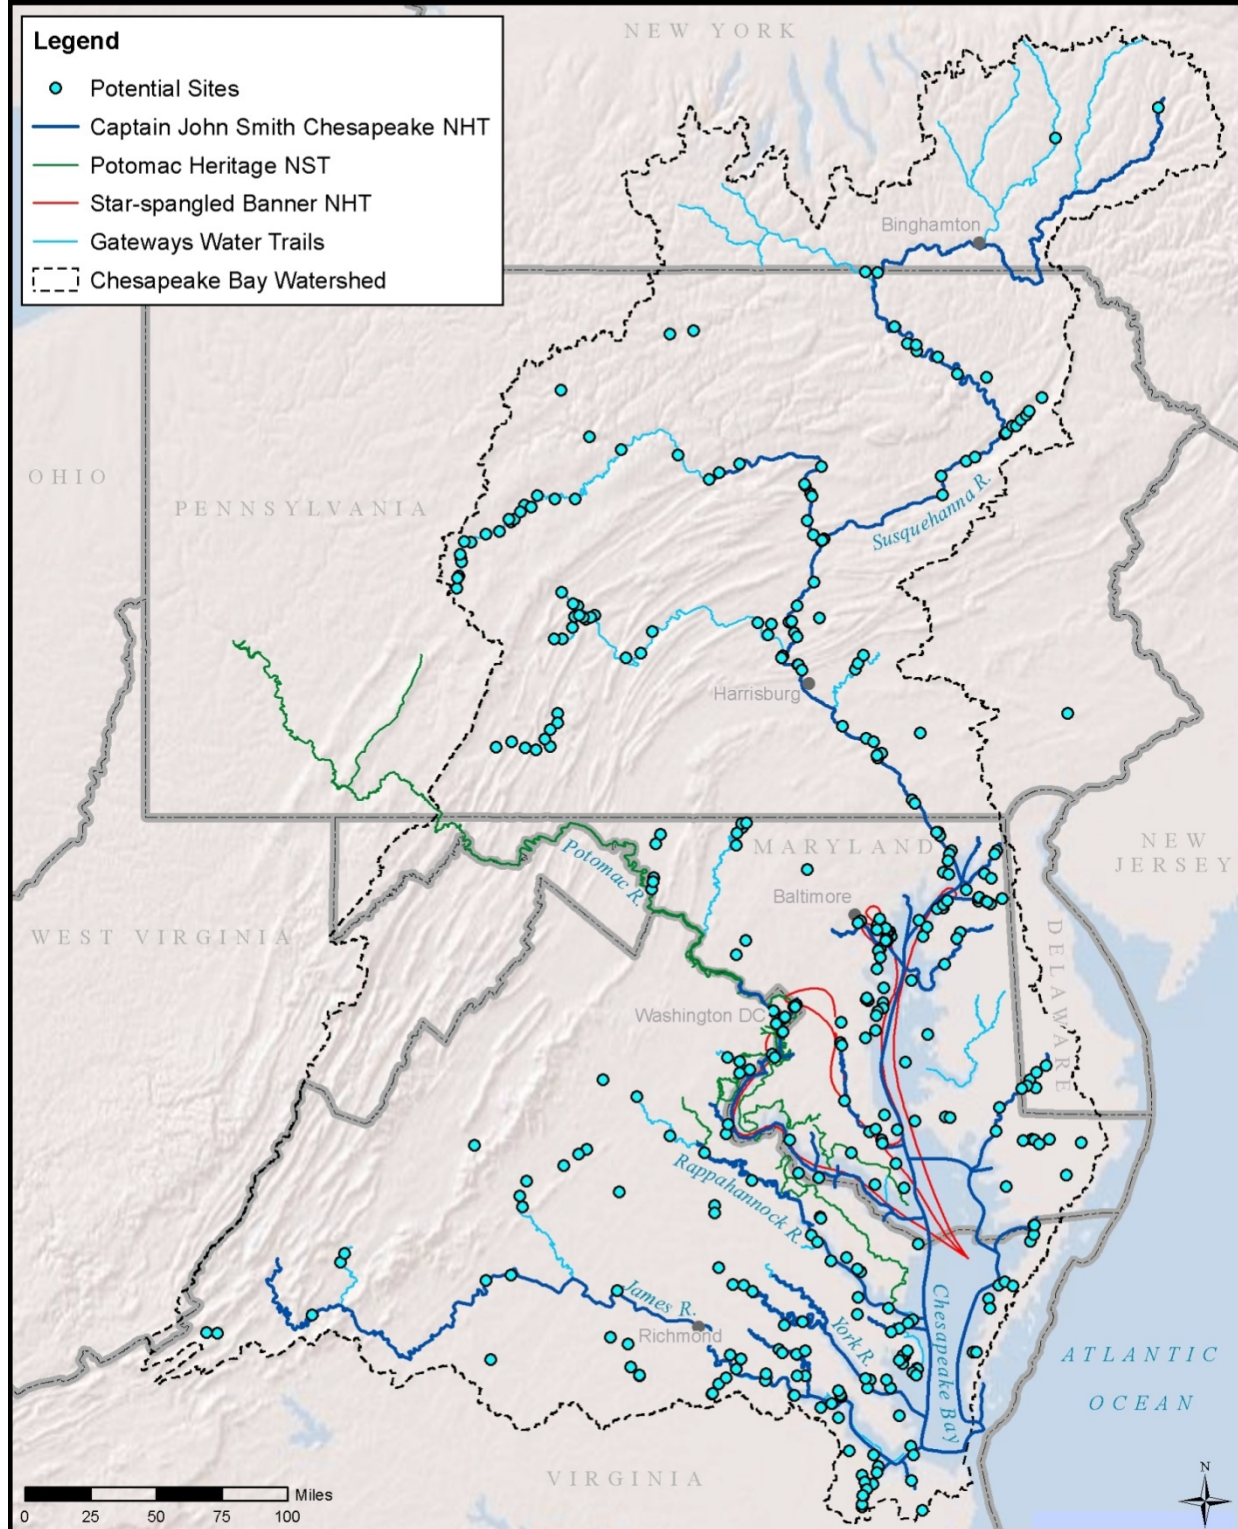

Chesapeake Bay Watershed Public Access: Density of Potential Public Access Sites

Potential Sites In Relation to Existing Water Trails

Because of the significant development of existing water trails in the Chesapeake Bay watershed, it is useful to understand how potential future access sites might relate to those trails. This plan shows how the potential access sites link with the Captain John Smith Chesapeake National Historic Trail, the Star Spangled Banner National Historic Trail, Potomac Heritage National Scenic Trail, and Chesapeake Bay Gateways water trails. [The map](#) on page 31 shows the existing trails with respect to the locations of the potential new public access sites. Development of any new sites along these trails will not only contribute to meeting the goal of 300 new sites, but also support a network of trails that can provide a broader depth of experiences to visitors by strengthening the connections between a location and its historical and/or environmental importance.

Chesapeake Bay Watershed Public Access: Trails and Potential Public Access Sites

NPS/Spielmann

Camping and Related Water-to-Land Access

In addition to the high public demand for new water access sites for boating, fishing, swimming, beach use, and viewing, there is also a strong interest in accessing camp sites from the water. Making a multi-day trip down one of the Bay's rivers can be difficult without a place to go ashore and camp for the night. Time and again, members of the paddling public expressed a desire for small primitive campsites, picnic areas, and restrooms at appropriate locations along water trails.

A system of appropriately planned water-access campsites would provide safe and legal places for boaters to stay. It could also enhance the eco-tourism benefits of water trails and bring more dollars into the local economy. Such sites could be located on public or private lands, through cooperative agreements with water trail managers.

Input from the public meetings, online survey tool, and state-led studies also revealed a full spectrum of access needs beyond the traditional land-to-water access. The growing interest in water trails extends to adding capacity for boaters to access historic sites, other important sites along waterways, food services, lodging, and other amenities. Detailing the needs and opportunities for these types of access is beyond the scope of this plan but merits attention in the future.

NPS/Jett

Successful water trails provide visitors with information on history, culture, and natural resources, as well as appropriate public access at needed intervals along the route.

VI. Planning and Policy Considerations

This plan is not intended as a general guide to public access planning. However, information gleaned through creating this plan brings to light a number of points to be considered when setting out a strategic approach to public access development. Some are factors or opportunities related to development of new public access sites. Others have the potential to impact existing sites. Each will require the attention of public access advocates and managers in planning strategies that address them.

Providing Public Access in Urban Areas

Some of the highest demand for additional public access is expressed in locations in and nearby urban areas, as illustrated in the map on page 29.

The nature of public access in urban environments is different from that of more rural settings. Development and urbanization of waterfronts, economic and social influences, population density, transportation systems, concentrated water pollution, and different levels of commitment to public access all combine to present substantially different circumstances and call for unique strategies. A few illustrative examples:

- The vast majority of the lengthy shoreline of Annapolis, Maryland, is privately owned and developed for commercial or residential use (with the exception of the US Naval Academy). This substantially restricts public access to the water. However, many city streets have historically ended at the water. A unique city initiative started in the 1960s focused on turning these “street ends” into small pocket parks on the water. Today there are more than 20 such parks, all providing views of the water and many providing boat docks, launching areas, and gathering spots.

NPS/Jett

NPS/Ross

- Much of the shoreline around Hampton Roads, Virginia, is dominated by military, industrial, and commercial development, limiting locations for public access. With the impending phase-out of military control of Fort Monroe, a broad and motivated coalition advocated to convert the base to a public park. As a result, Fort Monroe National Monument was established in November 2011 on approximately half of the base's original area, which could significantly enhance public access to both Chesapeake Bay beachfront and Mill Creek.
- There is substantial public land along portions of the Anacostia River in Washington, DC. However, highways, development patterns, water pollution, and lesser levels of public investment have historically reduced access to and use of the river by area residents. New attention on restoring and enhancing Washington's "other river" has the potential to revive access to the Anacostia. Comprehensive planning for access sites, water trail development, and other elements are guiding new strategies for this river.
- Baltimore's Patapsco River waterfront is a major commercial shipping port. Yet it is also a central attraction for visitors and residents, many drawn by the extensive Inner Harbor promenade. The city has developed a Maritime Master Plan, which establishes policies for the orderly development of recreational boating in the harbor while minimizing the potential for conflicts between commercial and recreational vessels. It identifies specific locations for recreational marinas, including type, size, and land area.

These examples highlight some of the special planning, design, and civic engagement considerations needed for urban access development. There is a further consideration as well.

Assessing socio-economic patterns in relation to public access can illuminate areas where access is most needed. For example, the Maryland Department of Natural Resources identified communities where children are underserved by public parks. While parks are different from water access sites, the principles used in the study are illustrative. The "Park Equity Analysis" is built upon US Census data combined with statewide layers identifying public and local parks.¹⁴ The model prioritizes underserved areas of Maryland in need of park space by identifying locations with:

- High concentration of children under the age of 16
- High concentration of populations below the poverty line

- High population density
- Low access to public park space

The analysis provides a fairly fine-grained identification of areas in most need of access to parks, most of which are in urban areas. Similar analyses could be developed to assess water access needs.

Water Trails as Motivators for Site Development

The number of water trails has increased significantly over the past decade with many local groups, communities, and government agencies playing a role in their development. Their increase in popularity can be tied to increased participation in paddle sports and a growth in use of trailerable power boats as a means to explore the Chesapeake Bay and its tributaries. They are also of interest to outfitters and tourism businesses. Well-planned and developed water trails contribute to an area's eco-tourism opportunities, drawing people from throughout a region to spend time and money along the trail.

Successful water trails, in addition to providing visitors with support facilities and information on history, culture, and natural resources, also provide appropriate public access at needed intervals along the route. Water trails with appropriately planned access can also help resolve user conflicts, as trail users are provided with needed facilities and encouraged to respect private property.

Designated water trails cover more than 3,200 miles of rivers and the open Bay in the Chesapeake watershed, many of these in relatively rural areas. The vast majority of potential access sites documented in this plan are along existing water trails.

New access sites are often needed to fill long gaps between existing sites and make a trail truly functional. Strategic assessments of access priorities along a trail route are key, including consideration of the sites' proximity to users, the ways in which a new site might affect carrying capacity in that area, and opportunities for redistributing use and reducing crowds at overused sites.

When there is strong local support for a water trail, effort is directed towards finding and developing the needed sites. Water trails often lead to partnerships among user groups, localities, local businesses, and state/federal agencies. Thus, water trails are often a catalyst for access development that may not have occurred otherwise.

NPS/Jett

NPS

Use Conflicts

Conflicts among users tend to develop when a site is designated or perceived to be designated for one use and is subsequently used in other ways. For example, people who are fishing, picnicking, or swimming may use a boat launch pier or parking area and conflict with those trying to launch or retrieve boats.

Conflicts also arise among users based on who is perceived to have paid for the access site. The great majority of boat ramps are paid for through registration fees and in some states from the excise tax collected from power boat owners. With the rapid growth in paddle craft use, more paddlers launch from ramps and use parking spaces that were traditionally used by power boaters. Some power boat operators complain that the use of facilities they paid for is hampered by paddlers who have made no direct investment in the facility.

In Virginia, a new fee has been approved to address this issue. In conjunction with its Wildlife Management Areas, the Virginia Department of Game and Inland Fisheries (DGIF) owns and manages many boat launches and access sites. Starting in 2012, anyone age 17 or older using a DGIF Wildlife Management Area facility must have a valid fishing license, hunting license, boat registration, or access permit. Access permits cost \$4.00 per day or \$23.00 per year. The funds from this program will support development and management of DGIF sites.¹⁵

Conflicts also occur when use of an access site impacts or may be perceived to impact adjacent landowners. For example, if the parking at an access site is full, users might park on the side of the road in a way that impacts local residents. Residents of some communities may also object to a proposed access site because they fear adverse impacts such as excessive noise or litter. As news of real or perceived conflicts spread, the development of nearby access sites can be difficult.

These issues point to the need for local land use plans and other planning documents to detail the importance of potential access sites and have them clearly marked on local comprehensive plans. Such action helps preserve the development of needed access sites in the future. Public access plans must consider potential use conflicts and select locations and designs that minimize them.

Railroads

Railroad tracks are a major barrier that limits access to many rivers in the Bay watershed, sometimes on both riverbanks. Railroad companies are generally opposed to granting at-grade crossings of rail lines for either vehicles or pedestrians, stating liability as their primary concern. If approved, a fully developed road crossing must be provided, with an automatic warning signal and gates that close off the road when a train approaches. Such crossings are expensive to build and have long-term maintenance and operational costs, making development of many access sites prohibitively expensive. This is particularly the case for paddle craft landings, where a small road crossing or even a pedestrian crossing is all that is needed.

Some states have enacted legislation indemnifying railroads from liability when they grant an at-grade crossing for public access. Railroads have argued this does not prevent a suit from being filed in another state should a user of the crossing be injured by a passing train. User groups and state partners involved in preparing this plan have suggested that federal legislation limiting railroads' liability when allowing public access crossings may be a viable solution. A resolution to this issue could open up many new miles of access opportunities on major rivers in the Bay watershed.

Access at Public Lands

Public lands, whether held by local, state, or federal government, provide many opportunities for access to streams, rivers, and the Bay. In some cases this access is relatively unlimited. In others there may be conflicts between public access and resource management, or access may be limited due to insufficient staffing levels or restrictions imposed by the type of funding used in the property's acquisition or development.

Nonetheless, public workshops revealed considerable concern over the limitations imposed on some public lands. In order to meet the public access goals expressed in Executive Order 13508 and the *Strategy for Protecting and Restoring the Chesapeake Bay Watershed*, public lands at the federal, state, and local level with frontage on streams and rivers should be re-evaluated on a unit-by-unit basis for their potential to add public access opportunities.

NPS/Jett

NPS/Spielmann

Permitting Requirements

Many public access managers and advocates reported that plan development, regulatory, and permitting requirements can have a major impact on the development of new access sites. Therefore federal, state, and local permitting authorities should consider expedited review procedures for some types of access site development. New public access sites need to be developed in an environmentally sensitive manner and permitting agencies should consider methods such as simplified permitting procedures, pre-approved design guidelines, and a review of appropriate mitigation requirements. The goal should be for a process that allows partners to work together efficiently and cost effectively when developing new public access opportunities.

Universal Accessibility

Public access sites are subject to federal and state guidelines for ensuring access by a population with diverse physical capabilities. It is the responsibility of access site managers to comply with the Architectural Barriers Act of 1968, Section 504 of the Rehabilitation Act of 1973, as amended, and the Americans with Disabilities Act of 1990, as amended. The high visibility of the accessibility law has generated a wide range of public interest and pressure to bring facilities into compliance. When facilities and programs are “universally designed” to serve all people, accessibility is generally enhanced for everyone.

Specific requirements will vary depending on the facilities and programs offered at the public access site. Early planning is important to evaluate opportunities to construct and operate the facilities and programs so they are accessible to, and useable by, persons with disabilities to the greatest extent reasonable. Accessibility accommodations should respond to the site context and conditions and be consistent with resource protection, visitor safety, and visitor experience goals. When marketing the site, it is most important to objectively and effectively describe the site conditions and abilities necessary for safe use, so that all potential users can make informed travel decisions. National Park Service staff and state public access coordinators can assist in evaluating accessibility accommodations.

Hydropower Licensing

The Federal Energy Regulatory Commission (FERC) issues licenses for all hydropower projects. One component of a license or a license renewal

is the provision of outdoor recreation. The licensing process can dictate that a power company provides public access sites either on the reservoir or on the waterways that feed the reservoir. In some cases, additional sites may not be needed on the main reservoir or a suitable site may not be available. In such instances, funding can be available to help construct new sites within or adjacent to the power company's service area. This funding may leverage support from other sources to enhance the number of sites that can be developed.

Hydropower licenses are typically issued for extended periods of time, some as long as 50 years. Re-licensing should not be a missed opportunity. State agencies involved in these licensing or re-licensing processes should make the case for increased public access as a part of the new license agreement. Some of the states in the Chesapeake watershed have already had success in developing new access through the FERC process.

State and Local Planning Documents

State and local comprehensive plans present an important opportunity for advancing proposed public access sites and actions to support them. They set out the guidance the state or community seeks to follow over time. Proposed access sites and public access policies should be incorporated, as appropriate, into these documents, including Statewide Comprehensive Outdoor Recreation Plans (SCORPs) and local comprehensive land use and capital improvement plans. Projects referenced in federal, state, and local planning documents demonstrate a higher level of importance when funding is being considered.

Working Waterfronts

Many of the Chesapeake's older working waterfronts are being lost. Seafood docks and oyster and crab processing facilities are closed. Adaptive reuse or rehabilitation of these structures could provide opportunities for recreational use and access in an impacted area. The sites could contribute to heritage and ecotourism, offering both new public access sites and appropriate support services. Where appropriate, the structures themselves could be used as interpretive tools to explain the life of the working waterman and those who support the Bay's seafood industry. They may also serve as docking and equipment storage sites for those who are still active in the fishing and crabbing business—or for outfitters and guides providing access and tour services. Such action may also help to maintain the working waterfront setting and increase the livability of

NPS/Jett

these old waterfront communities. Waterfronts and facilities of this type should be inventoried and evaluated for a possible future use as public access sites.

Transportation Improvements and Public Access

Many road projects involve bridges that cross streams or rivers with recreational value or closely parallel such resources. It can be extremely useful to establish a memorandum of understanding (MOU) between the state's recreation/resources agency and its Department of Transportation (DOT), recognizing the value of public access planning as a component of such projects. Access might consist of nothing more than safe shoulder parking with a walkable path to the water's edge for fishing or launching paddle craft, a bridge with a safe fishing area, or a ramp and parking area located under a bridge.

Generally speaking, the incremental cost of adding a public access site into a bridge or road project is fairly small, since much of the work is already done in conjunction with the DOT project. If the DOT is alerted to the potential of adding access into the transportation project early in the process and if a funding source is identified to cover the expense, these projects can cost much less than they would otherwise cost if done as an independent project at a later time.

NPS/Rogers

MOUs with DOTs could involve three key components:

1. A system for early coordination and review of proposed projects to determine which ones have public access potential; this should also include a timeline for review and the identification of the state resource agency that will review the plan as it relates to public access.
2. Early identification of a source to cover the incremental cost of the access project so the DOT knows the project can proceed and can be covered in their construction planning.
3. A process for identifying the managing entity for the completed project. Generally speaking, the DOTs do not wish to manage public access sites, so the MOU should contain a process for determining who will take on the management and maintenance of the site once it is completed.

Funding Sources, Issues, and Strategies

There are a number of funding sources for the development of public access sites, including all levels of government and the private sector. An annotated list of common sources is in appendix C of this plan.

Public sector funding for access sites has been more limited in recent years. This has hampered the development of new sites and created a backlog of major maintenance projects. It is now harder for some public agencies to justify new site development when they cannot keep up with maintenance on existing sites. Maintenance problems have in turn reduced use of some sites that suffer from channel siltation or storm damage but lack funding to make necessary repairs. Of particular concern are reductions in federal funding for maintaining shallow water navigation channels. This may well result in the loss of some existing boating opportunities as channels fill in and recreational boats are no longer able to use existing facilities. Loss of these channels would have a major impact on power boating and the significant economic value it brings to the region. As existing sites are lost, the value of adding new sites is diminished. It is clearly evident that a strong and stable funding source for the development and maintenance of public access sites is needed.

NPS/Jett

Setting Access as a Grant Program Priority

One strategy to encourage development of access sites is to prioritize funding such projects in competitive state and federal grant programs. This encourages applicants to look for projects that include access and thus receive higher scores in the competitive grant rounds. Public access projects would then be a priority in the grantmaking process, which will help to meet the goal of establishing 300 new public access sites by 2025. A similar approach could be used for grants administered by cooperating federal agencies to develop outdoor recreational facilities.

Non-Traditional Funding Partners

Traditional groups such as Trout Unlimited, sportsmen's clubs, watershed associations, and river user organizations will continue to be important partners in developing new public access. However, expanding access may also hinge on developing partnerships with groups and organizations not traditionally involved with developing public access sites. For example, both education and health agencies have acknowledged the importance of healthier lifestyles to reduce diseases associated with obesity. Attention deficit disorder has been linked to children losing their connec-

tion with the outdoors and spending large amounts of time on electronic media. Health and education agencies have funds to combat these issues; public access projects provide one means of partnering with them to meet shared goals.

Opportunities may also exist with designated state or national heritage areas. The development of new public access to waters within a heritage area may well contribute to established goals, while encouraging funds and support from groups that contribute to the heritage area.

Corporate America has long been a partner in supporting arts and humanities projects. In the Chesapeake watershed, some corporations or their foundations are now contributing to development of public access projects. They may own waterfront land that would be suitable for access and would be willing to make it available if the proper partnership for development and management were put in place. In other instances, a corporation may be willing to cover a portion of the cost for a new access site if it is located in their company's market area. Partnerships of this nature should be explored.

NPS

Fifty-three percent of the potential new public access sites are on lands already in the public ownership making them ideal candidates for further investigation.

VII. Summary and Next Steps

The information gathered during the development of this public access plan resulted in a series of key findings and next steps.

Findings

- Multiple studies and plans, including all state outdoor recreation plans, continue to document high public demand for access to streams, rivers, and bays.
- This plan establishes a new 2011 inventory of 1,150 public access sites along the Chesapeake Bay and its tributaries (fifth-order streams or higher). These sites provide boating, fishing, swimming, or viewing access to the water, or some combination of these activities.
- The number of access sites is very low in comparison to the amount of shoreline in the Chesapeake watershed. There are just 770 existing access sites along the shorelines of the Bay and tidal portions of its tributaries, a combined length of 11,684 miles—equivalent to the distance along the United States’ west coast from Mexico to Canada.
- There are many large lengths of shoreline where little or no public access currently exists—the southern bank of the tidal James River includes a 64-mile stretch with no regularly open access sites. Long, inaccessible stretches make it difficult to plan trips along water trails and reduce the benefits of ecotourism. A lack of public access may lead to trespassing, as users may believe they have no other option for getting on or off the water.
- State agencies report significant overcrowding at trailerable boat launching facilities along the Bay and tidal tributaries.

NPS/Jett

NPS/Spielmann

- This plan documents 320 potential public access sites identified by the public and through state access plans. These sites provide a basis for achieving the goal of adding 300 new public access sites by 2025.
- Ninety-seven percent of the potential public access sites are in Maryland, Pennsylvania, and Virginia, which constitute the largest land mass of the Bay watershed.
- Fifty-three percent of the potential new public access sites are on lands already in the public ownership making them ideal candidates for further investigation.
- While there are often multiple types of recreational uses suggested for a specific potential access site, some uses are recommended more than others. Boating access was most frequently suggested recreation type (47 percent of sites), followed by fishing (27 percent), viewing (22 percent), and swimming (4 percent).
- The highest densities of potential public access sites are generally, but not exclusively, concentrated around urban centers, particularly the Baltimore/Annapolis area and Hampton Roads area. Development of new public access sites in these locations could provide increased public access for large, diverse populations.
- The nature of public access in urban environments is substantially different from that of more rural settings. Urban areas require unique strategies, informed by additional, detailed analysis of community needs. Maryland's Park Equity Analysis presents an interesting example of one approach to this analysis.
- Most of the potential access sites are along thousands of miles of existing water trails and national trails (Captain John Smith, Star-Spangled Banner, Potomac Heritage). These trails present a substantial framework for advancing public access development, especially in more rural areas.
- The identified potential sites fall into three general categories of readiness for development:
 - Category 1) ready to go, with planning and permitting generally complete
 - Category 2) requires some additional planning and review prior to development
 - Category 3) needs substantial site analysis and planning before development can proceed.

- Only 5 percent of the 320 potential public access sites fall into category 1. Investments in detailed site assessments and project design and permitting are required for most potential sites if public access is to be expanded.
- There are a number of planning and policy considerations that can influence the expansion of public access—hydropower re-licensing, changing funding streams, railroads, transportation projects, etc. These provide opportunities and, in some cases, challenges to address.

Moving Forward

Maintaining existing public access and adding 300 new sites along the streams, rivers, and bays of the Chesapeake watershed is no small task. Yet this plan sets out a pathway to achieve this goal; acting on the steps below will move the expansion of public access forward.

1. *Make funding for public access a priority.* Sustain funding for development of new sites and maintenance of existing sites, including maintenance dredging of small channels. Relevant state and federal funding or matching grant programs should target or give bonus points for projects that include new public access sites. For example, the National Park Service will continue to prioritize funding for public access site development in Chesapeake Bay Gateways and Watertrails Network grants.
2. *Carry out and support more detailed assessments and project design for potential sites.* Most of the 320 potential new sites identified in this plan require more detailed assessments and construction designs prior to implementation. Pre-planning and design of public access sites is a key step in their future development. This is an area in which funding is needed. Agencies at all levels should provide, within resource capabilities, technical assistance, and funding for site design and analysis.
3. *Fill strategic gaps in access along water trails.* The National Park Service will work with partners to identify, prioritize, and develop sites that fill public access gaps along the Captain John Smith Chesapeake National Historic Trail, Star-Spangled Banner National Historic Trail, Potomac Heritage National Scenic Trail, and the Chesapeake Bay Gateways and Watertrails Network.
4. *Incorporate identified proposed public access sites and actions in key plans.* Elements of this plan, including potential public access sites and

NPS/Spielmann

key actions, should be incorporated as appropriate into major state outdoor recreation and open space planning documents, such as Statewide Comprehensive Outdoor Recreation Plans (SCORPs). Partners should encourage local governments to incorporate potential public access sites and policies in local comprehensive and capital improvement plans.

5. *Further examine urban public access issues and needs.* Recognizing the complex factors associated with expanding access in urban communities, governments at the local, state, and federal levels should support and pursue studies assessing specific urban access issues and needs.
6. *Work with private sector funders to develop access.* Many companies and foundations often have objectives that can be advanced through partnerships to develop public access sites and facilities. There are numerous examples in the Chesapeake watershed. Public access managers and advocates should actively work with private sector funders on access projects.
7. *Engage in hydropower re-licensing processes to expand public access.* Re-licensing of existing hydropower projects provides significant opportunities for expanding access to the water. Local, state, and federal agencies should participate in re-licensing processes to make the case for specific public access projects as a part of new license agreements.
8. *Explore options for resolving railroad crossing liability.* Railroads along rivers—and associated liability concerns over track crossings—limit water access. Some states have indemnified railroads from liability at at-grade crossings for public access purposes, but suggest that federal action to limit liability may be needed to address the railroads' concerns.
9. *Establish memoranda of understanding (MOUs) with transportation departments.* Many road projects across or adjacent to streams or rivers could provide public access opportunities. Where they do not yet exist, a state's recreation/resources agencies and its department of transportation should consider establishing an MOU to ensure such opportunities are not missed.
10. *Explore potential for additional access on public lands.* Management objectives and practices on public lands may not account for recent changes in access needs and opportunities. As circumstances permit, managers of public lands fronting streams and rivers should re-evaluate these lands' public access potential. This can

NPS/Rogers

occur through regular master planning processes or as ad hoc assessments.

11. *Fully address accessibility at public access sites.* Public access sites are subject to federal and state guidelines for ensuring access by a population with diverse physical capabilities. Yet it is not always clear how some of these guidelines may apply, particularly to boating access sites. The National Park Service should work with its many partners to clarify approaches to addressing accessibility needs.
12. *Build opportunities for citizen stewardship.* Many public access sites are remote from regular maintenance staffs. Communities, user organizations, water trail managers, and others should work to develop volunteer citizen stewardship programs to care for and maintain specific access sites.

NPS/Jett

Conclusion

The Chesapeake Bay and its major tributaries are the region's ecological and cultural lifeblood. They are also the primary features that have shaped human habitation here for millennia. American Indians lived beside them, used their resources, and travelled along them; English settlers did the same. Into the twentieth century, these watercourses were a mainstay of regional transportation. Resorts sprang up at the end of short rail lines leading to the Bay, drawing weekend escapees from muggy cities. All of the region's major cities are sited on Chesapeake rivers. The iconic images defining the Chesapeake region are all associated with the water: crabs, oysters, rockfish, watermen, skipjacks, lighthouses, waterfowl, sailing, and more.

Today, rivers and the Bay are the most frequent locations of public parks and wildlife management areas. They are the basis for the burgeoning growth of water trails, which provide routes for exploring the water by boat. On a good summer day—or spring or fall day for that matter—waterside parks are full of people.

But year after year, residents of the Chesapeake watershed repeat the refrain: access to the water is too limited. Where historically many residents of the region worked in association with the water on a daily basis, today too few get the chance to even interact with it. Ironically, the very resource that defines the region has become one that is hard for many people to reach.

This plan sets out an agenda for solving this problem. It identifies specific opportunities for expanding the number of places for people to access the water by more than 20 percent by 2025. It also defines a series of planning considerations and next steps that will be instrumental in achieving this goal.

NPS/Ross

Ultimately, this undertaking is not just about adding more boat launches or fishing piers. It is about extending the scope and range of access to the water to greater and greater reaches. Citizens of the region want more places along the water where they can walk, sit, play, picnic, camp, swim, fish, watch wildlife, and put in their canoes, kayaks, paddleboards, sailboats, and powerboats. Public access to the Chesapeake Bay and its tributaries is important to their quality of life.

- ¹¹ Of the 1,144 existing public access sites documented as of September 2011, 15 sites were interpreted to have been established between October 2010 and September 2011, the first year of tracking progress toward the goal of adding 300 new sites in the watershed (see appendix A for more detailed explanation). This means the baseline for tracking progress toward the goal is 1,129 sites (1,144 minus 15).
- ¹² To calculate the average distance between existing public access sites, the river banks and tidal shorelines in the study area were divided into segments. The non-tidal portion of each uniquely named fifth-order stream and higher was treated as a separate segment; the tidal portion of each stream was treated as a separate segment. The portions of the Chesapeake Bay shoreline (including small tidal tributaries) between fifth-order streams and higher were also treated as separate segments. Existing public access sites along each segment were then manually counted. Segment lengths were calculated using geographic information system software. For rivers and streams, the

segment length reflects the total length of both riverbanks; because of limited river crossings an access site usually just serves one side of the river. The average distance between existing sites was then calculated for each segment by dividing the length by the number of sites manually associated with it.

¹⁴ *Park Equity Analysis, Maryland Partnership for Children in Nature, Maryland Department of Natural Resources, 2011/2012*. Available at: drn.maryland.gov/cin/. Strategic provision of public access sites in and adjacent to urban areas will produce multiple public benefits. Moreover, access to streams, rivers, and bays may be the public's sole interface with water quality. Expanding public access in urban and suburban areas where people and water quality issues are concentrated is important to long-term support for restoring clean water.

Appendix A

Public Access Milestones, Baseline, and Tracking

Background

The *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* issued under Executive Order 13508 sets out a basic rationale for increasing public access:

Physical access to nature and the Bay and its rivers is limited. If a core Chesapeake restoration goal is to make the Bay and its tributaries “fishable and swimmable,” then increasing public access to the water is not only an end goal, but also a necessary step to get there. Access to water allows people to enjoy fishing, hunting, swimming, kayaking, hiking, and picnicking, which create opportunities for public education, personal connections with nature, citizen stewardship, and land conservation.

The strategy also sets the goal to “increase public access to the Bay and its tributaries by adding 300 new public access sites by 2025.” As the measure of progress toward this goal, the strategy defines public access sites as follows:

A [public access] site is a location providing access to the water through a boat ramp, fishing pier, swimming area, or adjacent boardwalk or trail; water means the Chesapeake Bay and its tributaries.

The Public Access Action Team involved in developing this plan further refined the definition of public access sites and established a definition of “new” access sites to create consistency in tracking. As a result, the following conditions count towards the 2025 goal:

- Development of a new public access facility on a new site
- Development of a new type of access at an existing site (For example, if a fishing pier is developed at a site that currently has a boat ramp, the pier would count as a new public access towards the goal.)

Annual Tracking Process for Executive Order Goal

Previous tracking efforts in support of the Chesapeake 2000 commitment were coordinated through the Chesapeake Bay Program each year through a simple data-call process. Representatives from Pennsylvania, Maryland, and Virginia (the states included in the process at that time) would annually report the number of public access sites that were developed in their jurisdictions to the Chesapeake Bay Program. The cumulative sum of baseline data and annual updates from state partners were reported as the number of public access sites within the watershed.

The Chesapeake Bay Program’s Public Access Action Team, a partnership of all Chesapeake Bay states, federal agencies, and relevant nonprofit partners with National Park Service leadership, will

continue to coordinate public access tracking updates. In the new tracking process, designated state agency staff will use a simple, online system to input the geographic locations of newly developed access sites, based on the established definitions of “new” and “public access.” Public access program staff will also use this online system to fill out a few fields of information (name, water body, access type, ownership, etc.) on each new site. Additional information, such as project cost, can also be collected through the online tool if deemed necessary.

The information will be collected consistently in January of each year from 2013 through 2025. This updated tracking process will be an improvement over past efforts, because it will mark the location of new sites directly on an interactive map and provide a significantly wider range of information. As new sites are developed, they will be tracked to meet the Executive Order goal while allowing the public to observe the progress.

Milestones

State programs will not be assigned allocations related to the development of public access sites to meet the Executive Order goal. Instead, a collective milestone of 20 additional sites per year will be tracked annually to determine progress towards the overall goal. This milestone is intended to show progress towards the goal, and is not meant to be a target in itself. Based on the opportunistic nature of public access site development, the lack of dependable funding for access projects, and the trends of public access development from the past decade, some years will likely fall below the annual milestone and some years above.

Each year the Public Access Action Team will convene to validate the updates made to the online system, discuss issues associated with tracking, and adjust the process if needed.

Public Access Baseline for Tracking Purposes

The *Strategy for Protecting and Restoring the Chesapeake Bay Watershed* set a baseline of 761 existing public access sites for tracking progress toward the goal of adding 300 new public access sites by 2025. Because of the extensive new inventory of access sites included in this *Chesapeake Bay Watershed Public Access Plan*, this baseline must now be updated.

As indicated in the June 2012 draft plan, a total of 1,144 existing public access sites were identified as providing access to the Chesapeake Bay and its streams (fifth-order and higher) as of September 2011. Specifically, there were 6 existing public access sites in Delaware, 578 in Maryland, 26 in New York, 180 in Pennsylvania, 287 in Virginia, 44 in West Virginia, and 23 in Washington, D.C. The dates of site development were not collected during this extensive inventory. As a result, the number of new public access sites developed in the federal fiscal year (FY) 2011—the first year of tracking toward the goal of 300 new sites—is unknown. These sites are included within the list of 1,144 existing public access sites created in September 2011.

However, the number of new sites in FY 2011 must be estimated in order to revise the tracking baseline for the coming years. The Public Access Action Team developed the following strategy for this estimation.

As a part of the Chesapeake 2000 commitment, Maryland, Pennsylvania, Virginia, and Washington, D.C., reported the number of new public access sites developed within their jurisdictions each year between the years 2001 to 2010 (table 1). On average, 15 sites were added each year in the portion of the watershed within these jurisdictions.

Table 1: New Access Sites Created in the Chesapeake Watershed					
Year	MD	PA	VA	DC	Total
2001	10	0	5	0	15
2002	8	0	5	0	13
2003	0	0	2	0	2
2004	14	3	2	0	19
2005	15	11	5	0	31
2006	13	7	22	0	42
2007	0	3	6	5	14
2008	4	3	4	0	11
2009	4	0	0	0	4
2010	1	5	0	0	6

This plan uses that average number—15 sites per year—to represent the number of public access sites developed in FY 2011. This number is subtracted from the 1,144 existing sites identified through the development of this plan to determine the new Executive Order baseline, as shown in table 2.

Table 2: New Executive Order Baseline & 2011 Update								
	MD	PA	VA	DC	DE	NY	WV	Total
EO Baseline	572	177	282	22	6	26	44	1,129
2011 Update	578	180	287	23	6	26	44	1,144

Some existing sites managed by local governments have still likely escaped the heightened documentation process that took place during the development of this plan. As these sites are identified in the future, they will be added to the inventory as previously existing sites. This will increase the baseline from which additional new access sites are tracked.

(Intentionally blank for two-sided printing.)

Appendix B

Potential Access Sites

The following pages contain a list of potential public access sites in the Chesapeake Bay watershed. This list was compiled from a variety of sources, including public comment, while creating the Chesapeake Bay Watershed Public Access Plan. However, the identification of potential access sites is not a closed or static process. New opportunities will be continually added to this list. To recommend potential new access sites not included in this list, please use the online mapping tool at <http://www.baygateways.net/AddPA>. The online instructions will explain how to mark and describe a site. Recommendations will be included in future updates to the data supporting this plan.

Nansemond River West Branch	Suffolk	Brady's Marina	VA59	Private	Yes	Yes	No	Yes	Public	The old, private marina that currently exists at this site is in disrepair and may be very costly to purchase and renovate, but the location is very good.	2	Yes	No	No
North Fork Rivanna River	Albemarle	Dickerson Road Bridge Crossing	VA75	Unknown	Yes	No	No	No	Govt. Agency	This would be a good site for paddle craft if it is developed with a companion site. This site is recommended for public access in the 2007 Virginia Outdoors Plan.	2	No	No	No
North River	Mathews	Rt 617	VA13	Unknown	Yes	Yes	No	Yes	Public	Access at this location would connect the Mathews Blueways Water Trail to Mobjack Bay.	3	Yes	No	No
Occoquan River	Fairfax	Occoquan Regional Park	VA69	Local Govt.	Yes	Yes	No	Yes	Public	This site has an existing, town-managed facility in place. It is owned by the Regional Park Authority	2	Yes	No	Yes

VIRGINIA (continued)

Water Body	County	Site Name	Site ID	Current Ownership	Potential Activities				Source	Special Notes	Plan Category	Relationship to Existing Trails		
					Boat	Fish	Swim	View				CAJO	STSP	POHE
Occoquan River	Prince William	Lake Ridge Park	VA109	Local Govt.	Yes	No	No	No	Govt. Agency	A 2011 application to the Chesapeake Bay Gateways financial assistance program suggests the development of ADA-accessible docks for kayaks and canoes at Lake Ridge Park, as part of the Occoquan Water Trail.	2	No	No	No
Onancock Creek	Accomack	Onancock School Landing	VA95	Unknown	Yes	No	No	No	Public	Boating access is suggested for this site, which is part of the Onancock Creek Water Trail Project and would be a good companion site for educational programming.	1	Yes	No	No
Onancock Creek	Accomack	Poplar Cove Wharf	VA34	Private	Yes	Yes	No	Yes	Public	This site has an old marine railway and is a scenic destination for bicyclists riding from Onancock. Water depth is insufficient for motorboats, but the old railway could be developed into a good paddle craft launch if parking was provided.	3	Yes	No	No
Pagan River	Isle of Wight	Rt 623 Bridge Crossing	VA102	Local Govt.	Yes	Yes	No	No	Public	The potential exists to develop a paddle craft launch on property adjacent to the Rt. 623 Bridge. The site appears suitable for parking and a paddle craft launch.	2	Yes	No	No
Pamunkey River	Hanover	Below Route 301 Bridge	VA82	Unknown	Yes	No	No	No	Govt. Agency	Boating access is suggested at this site, which is recommended for public access in the 2007 Virginia Outdoors Plan.	2	No	Yes	No
Pamunkey River	King William	Judy Swamp	VA47	Unknown	Yes	Yes	No	No	Public	The Pamunkey River currently has very limited public access. This site is located in the middle of three proposed light boat access sites and would be a good site for paddle craft.	3	No	No	No

VIRGINIA (continued)

Water Body	County	Site Name	Site ID	Current Ownership	Potential Activities				Source	Special Notes	Plan Category	Relationship to Existing Trails		
					Boat	Fish	Swim	View				CAJO	STSP	POHE
Pamunkey River	King William	Route 360 Bridge	VA46	Unknown	Yes	Yes	No	No	Public	The Pamunkey River currently has very limited public access. This site is located close to major population centers and has good wildlife viewing opportunities. It was previously considered for public access development by the VA Department of Game and Inland Fisheries. The site was found to be not suitable for motorboats, but would serve paddle craft if a companion site is identified.	3	No	No	No
Pamunkey River	King William	Route 360 Crossing	VA81	Unknown	Yes	No	No	No	Govt. Agency	Boating access, especially for paddle craft, is suggested at this location on Big Creek off of the Pamunkey River. This site is recommended for public access in the 2007 Virginia Outdoors Plan.	2	No	No	No
Pamunkey River	King William	Route 615 Bridge	VA48	Unknown	Yes	Yes	No	No	Public	The Pamunkey River currently has very limited public access. This is the uppermost site in a series of three proposed light boat access sites and would be a good site for paddle craft.	3	No	No	No
Pamunkey River	New Kent	Route 624	VA45	Unknown	Yes	Yes	No	No	Public	The tidal portion of the Pamunkey River currently has very limited public access.	3	Yes	No	No
Pamunkey River	New Kent	Big Creek	VA80	Unknown	Yes	No	No	No	Govt. Agency	This would be a good location for paddle craft access.	2	Yes	No	No
Perrin River/ York River	Gloucester	Cooks Landing	VA23	Unknown	Yes	No	No	No	Public	Historically, this area has been a commercial seafood landing. However, a transfer of ownership has left watermen in need of a docking site. Boating access is suggested at this site, though commercial and recreational needs would have to be examined to ensure compatible use.	3	Yes	No	No
Piakatank River	Middlesex	Deltaville	VA72	Unknown	Yes	No	No	No	Public		2	Yes	No	No

Piankatank River	Mathews	Route 3 Bridge	VA19	Unknown	Yes	No	No	No	Public	There is an existing, unimproved launch site at this location.	3	Yes	No	No
Potomac River	Fairfax	Riverside Park	VA29	Federal Govt.	No	Yes	No	Yes	Public	This site is along the GW Parkway. Federal restrictions need to be reviewed to assess if public access is feasible at this location.	3	Yes	Yes	Yes
Potomac River	Stafford	Crow's Nest Natural Preserve	VA114	State Govt.	Yes	No	No	Yes	Govt. Agency	The large area of protected open-space, plus its location near a major population center represent great potential for passive recreation and outdoor education opportunities. The preserve is open to a limited degree, but significant staff and operations resources are needed before public access can be effectively implemented. The Brooke Road access point offers a short birding/nature trail to a viewpoint of Accokeek Creek. Plans are in the works to add a paddle craft launch onto Accokeek Creek by 2013. Hiking trails are also under construction that will feature interpretive information about the natural and cultural history of Crow's Nest. Stafford County shares ownership of this site.	2	Yes	Yes	Yes
Potomac River	Westmoreland	George Washington Birthplace Nat'l Monument	VA116	Federal Govt.	Yes	No	No	No	Govt. Agency	This site has frontage on both the Potomac River and Popes Creek. There is the potential for a suitable paddle craft launch.	3	Yes	Yes	Yes

Appendix C

Potential Funding Sources

Listed below are a series of federal and state funding sources that can be used to support public access development. This is only a partial list of potential funders for access sites. Local governments have direct funding capabilities not shown here; various corporations and foundations support access site expansion as well.

Federally Funded Programs

- *Chesapeake Bay Gateways and Watertrails Network*: This National Park Service program provides financial and technical assistance for public access site development in association with some 170 sites or trails in the Gateways and Watertrails Network and along the Captain John Smith Chesapeake National Historic Trail and Star-Spangled Banner National Historic Trail. Financial assistance requires a 1:1 match.
- *Boating Infrastructure Grant Program (BIG)*: Administered by the U.S. Fish and Wildlife Service, this program provides grants for transient moorage (tie-ups) serving recreational motorboats 26 feet and longer. Could help with water to land access. Financial assistance requires a 25 percent match.
- *Transportation Enhancement Program*: Administered by the Federal Highway Administration and state departments of transportation, this program may fund access projects if directly tied to history of water based transportation. Financial assistance requires a 20 percent match.
- *Recreational Trails Program (RTP)*: This program provides funds to states to develop and maintain recreational trails and trail-related facilities for both non-motorized and motorized recreational trail uses. The RTP is an assistance program of the U.S. Department of Transportation's Federal Highway Administration. This program may fund access projects if it can be shown that the site is a part of a designated water trail. Financial assistance requires a 20 percent match.
- *Land and Water Conservation Fund (LWCF)*: Through the "state-side" of the LWCF, the National Park Service provides matching grants to states and local governments for the acquisition and development of public outdoor recreation areas and facilities. Funding can include both acquisition and development and requires a 50 percent match.
- *Sport Fish Restoration and Boating Safety Trust Fund (Dingle-Johnson/Wallop-Breaux)*: This program, administered by the U.S. Fish and Wildlife Service, may fund land acquisition and the development, operation, and maintenance of boating access facilities. Financial assistance requires a 25 percent match.

State-Funded Programs

- *Maryland's Program Open Space (POS)*: This is a nationally recognized program that funds acquisition and recreation facility development. The local grant component (local-side POS) provides financial and technical assistance to local subdivisions for the planning, acquisition, and/or development of recreation land or open space areas. The state component (state-side POS) involves analysis, rankings, and on-site inspections to verify ecological benefits and cost factors. The Maryland Department of Natural Resources (DNR) will consider purchase of lands outside of the updated Green Infrastructure for exceptional recreational, cultural, historical, educational, water access, resource-based economic, and in-holding/management purposes in existing DNR-managed land and parks.
- *Maryland Waterway Improvement Fund*: This program, administered by the Maryland Department of Natural Resources, provides funding to local, state, and federal agencies in the form of matching grants for a variety of capital projects, services, and safety initiatives for the boating public.
- *Virginia Land Conservation Fund*: This fund, administered by the Virginia Department of Conservation and Recreation under the Parks and Open Space category, can fund the acquisition of land for public access. Projects require a 1:1 match. Applications are accepted from both government entities and nonprofit organizations.
- *Virginia Saltwater Fishing Recreational Development Fund*: This program, administered by the Virginia Marine Resources Commission, may fund the development of public access projects in the areas of the state requiring a saltwater fishing license and would enhance fishing opportunity. Projects require a 25 percent match.
- *Virginia Motor Boat and Water Safety Fund*: This fund can be used for the administration, law enforcement, boating education and safety, and purposes of direct benefit to the boating public. The Department of Game and Inland Fisheries is considering the development of a local grant program for public access using this fund. If this program is approved, it would require a 25 percent local match.
- *Pennsylvania Access Improvement Program*: This program provides compensation to landowners who grant a public fishing access and conservation easement to the Pennsylvania Fish & Boat Commission.
- *Pennsylvania Community Conservation Partnership Grant Program (C2P2)*: This program, administered by the Pennsylvania Department of Conservation and Natural Resources, offers a wide range of grant and technical assistance programs to help communities, land conservancies, and non-profit organizations plan, acquire, and develop parks, recreation facilities, and river resources. Grants require a 1:1 match.
- *Delaware Land & Water Conservation Trust Fund (DTF)*: This program funds active and passive outdoor recreation facilities and land acquisition. Car-top launch sites are eligible for funding assistance. Larger water access sites are encouraged to seek Sport Fish Restoration and Boating Safety Trust Fund (Dingle-Johnson/Wallop-Breaux) funds. Grants require a 1:1 match.
