

RATIONAL & CREATIVE PROBLEM-SOLVING BY GOVERNMENTS

Rather than the only tool of
austerity, foundations can support
research and development to help
governments understand how to
create sustainable families and
sustainable, creative communities

- Venezuela and Syria, like many countries around the world, are undergoing a severe crisis, and the people are suffering greatly.
- Many governments are ineffective in solving problems rationally and creatively.
- Government leaders use power to get into office, and maintain order, even though they don't solve problems.
- Behind the scenes, other governments, and big businesses, may work to take advantage of ineffective governments.
- Many people around the world have lost faith in the concept of *World Government*

because they see high-level bureaucrats aligned with neo-liberal wealthy elites in the IMF and World Bank who then use *austerity* as their only tool for problem-solving.

- They need to be experimenting with, and supporting, creating *sustainable families* and *creative communities* to help people solve their problems.
- Most people need work to survive. As robots take more jobs, and as population rises, we need to understand *how to create sustainable families* and *sustainable, creative communities that take care of nature*.
- We need dialog on this and a foundation to support this exploration.
