

Comments of End Users Sector on Remaining Sensitivities  
June 30, 2011

Catherine,

With regard to the use of the two available "High Carbon" sensitivities in Futures 2 & 3, it is the preference of the End Users Sector to use one of them to run an additional "Low Carbon" price sensitivity in Future 2. If that run provides meaningful results, then we would prefer to have the same run in Future 3 with the remaining sensitivity. If, however, the results are not meaningful, then we would propose to save the remaining sensitivity for scenario development, thereby providing a total of 5 sensitivities reserved for such purpose.

We appreciate the desire expressed by certain sectors to run a high (50%) intermittency sensitivity in Future 8 and believe that running of such a sensitivity can be accomplished by modifying one of the sensitivities already available in that Future and would not oppose any such proposed modification, subject to the caveat that any additional costs resulting from or associated with such an increase to the penetration limit be identified and captured."

Thank you,  
Brenda
