

Invisalign

In the past, getting braces has been associated with years of painful adjustments and struggling with self-image. But since 1999, Invisalign has literally changed the face of orthodontics for over half a million satisfied patients – and now, they are safe for teens as well.

Instead of wires or bands attached to the outside of your teeth where the world can see them, Invisalign treatment utilizes cutting edge technology to prepare a series of clear plastic molds of your teeth during each stage of alignment. Every two to six weeks, we will check on your progress and give you the next mold, or "aligner," to keep your treatment on track.

They are practically invisible, and can be safely worn during sports and other activities. The aligners are removable, making for easier eating, brushing and flossing. They move your teeth into place gradually, but in a much shorter length of time than normal braces – you'll achieve results in six months to a year with Invisalign.

Invisalign can improve the smiles of teens with crossbites, overbites, underbites, crowded teeth or teeth that are spaced too far apart.
