

- *Crusader is a flexible and forgiving ryegrass variety. It has a place in most North American farming regions.*
- *Spring planted Crusader has become a powerful alternative to forage cereals in the Midwest.*
- *Fall planted Crusader, in the Intermountain regions and the West Coast, can extend quality feed past the life span of annual ryegrass.*
- *Crusader's rapid establishment and vigorous growth offers early grazing opportunities and maximum yield potential for winter feeding.*
- *Crusader is a diploid variety with high tiller density and excellent heat tolerance. With a heading date later than a common annual, Crusader provides productive and leafy pasture in late spring - early summer.*
- *Residual management of Crusader in the fall has greatly increased its winter survival.*

Crusader makes it easier to manage and budget winter feed. Crusader's increased early growth provides the winter grazing needed for a better start to the spring.

Crusader will lengthen a corn/alfalfa/cereal crop rotation. An 18 month Crusader "break" rejuvenates the soil, cycles more manure and reduces input costs.

Sowing Guide

- Seed in fall or spring (in summer moist areas).
- Seed at 20-30 lbs/acre.
- Seed at 10 lbs/acre with 2 lbs brassica, such as Hunter forage brassica or Winfred rape.
