

# Leaf Classification:

**Classification:** the process by which scientists **identify** and organize objects.

referred to as “**venation patterns**”.

**Parallel**

numerous veins extending the length of the leaf, all parallel to one another

**Pinnate**

feather-shaped leaves, with one main vein running the length of the leaf and smaller veins branching off the main vein

**Palmate**

shaped like the palm of a hand, with several large veins starting from a central point at the end of the stem, extending out in several directions toward the edge, with smaller veins branching off from the large veins

# Leaf Classification:

## Leaf Edges (Margins)

Toothed

Lobed

Scalloped

Fuzzy

Smooth

Fan

Round

Heart

Compound

Spear

Needle

Triangle

## Leaf Shape of the Blade

# Leaf Classification

*Hint: These would make great short answer questions for a future quiz. Take notes. : )*

## ***What is classification?***

A process by which scientists identify and organize objects and organisms to show relations.

## ***What are three different ways you can classify leaves?***

1. Venation patterns (leaf veins)
2. Edges or margins
3. Shape.

## ***If you had a collection of insects, how would you classify them?***

- Features (wings, no wings, # of legs, etc.)
- What it eats
- Where it lives
- Did it complete a metamorphosis or not?
