EB-3153

Sequential Logic

The EB-3153 Sequential Logic board is a comprehensive instructional module designed to introduce the student to the basic concepts of flip-flops, registers, counters and sequential logic circuits to students in high schools, technical schools and colleges.

The module contains various practical circuits with which the student can perform a number of meaningful experiments, which help reinforce the student's comprehension of the related concepts. The individual circuits and the required test equipment can be quickly wired by using the provided patch cords to connect the relevant 2-mm jacks. Students perform a minimal amount of wiring, thereby reducing the setup time and the possibility of a wiring error while increasing the time available for training. Manually inserted faults modify the circuits under test to provide valuable true-to-life troubleshooting exercises, which develop diagnostic skills.

A comprehensive student experiment manual provides essential theory and clearly details the experiment procedure. Optional courseware enhances the learning procedure testing the student's level of competence after reviewing the theory and then evaluates all answers to questions to test the student's level of achievement at the end of each experiment. The student may learn in the standalone mode or under the optional DCML (Degem Computer Managed Laboratory), which allows the instructor to monitor student and class progress and records pertinent records in a database for future retrieval.

Specifications

DESCRIPTION

The EB-3153 printed circuit board is designed to minimize circuit wiring time when setting up experiments. The board dimensions are 220 x 180 mm is powered by the EB-3000 base unit. The board plugs into the EB-3000 base unit via a 48-pin industrial connector.

All components are mounted on the printed circuit board and the schematic diagrams of all circuits are silk-screened to help the student identify components and system operation. The printed circuit board is solder masked for long life. The components mounted on the board are protected with a plastic cover that is permanently mounted on the EB-3000 base unit.

All major signals can be accessed from the 2-mm jacks to simplify connections within the circuit and to test equipment. The printed circuit board can be stored in the supplied binder for convenient storage.

EXPERIMENTS COVERED

S-R Flip-Flop

- Basic concepts
- Clock controlled S-R flip-flop
- D latch
- Observe R-S flip performance
- Observe the effect of the clock

J-K Flip-Flop

- Basic J-K flip-flop
- Clock-controlled J-K flip-flop
- T Flip-Flop, D flip-flop
- Edge triggered flip-flop

Implementing a register

- Shift register with J-K flip-flop
- Test 4-bit shift register
- Create a ring counter

PISO and SIPO registers

- Parallel in and out
- Serial in and out
- Transfer data between registers
- Connect a PISO to a SIPO register
- Serial to parallel conversion
- Parallel to serial conversion

Serial processing

- Serial AND operation
- Serial ADD operation
- Serial logic operations

Ripple counter

- Up binary ripple counter
- Down binary ripple counter
- Modulo n and divide by n
- Up BCD ripple counter
- Integrated ripple counters

Synchronous counters

- Up binary synchronous counter
- Up/down binary synchronous counter
- BCD synchronous counter
- Programmable synchronous counter
- Integrated synchronous counters
- Counter applications

Troubleshooting

- 6 different fault-finding exercises

REQUIRED ACCESSORIES

EB-3000 workstation with built-in digital multimeter, oscilloscope and patch cords

OPTIONAL ACCESSORIES

- Personal computer with MS-Windows
- DCML Degen Class Management Software

INSTRUCTIONAL MATERIALS

The experiment manual was written by pedagogical experts who train technicians in electronics technology. The student manual contains essential theory and a detailed procedure for each experiment and is available in hardcopy or electronic book formats.
