

We are living in the most polluted environment in Earth's known history. We are continually inhaling and assimilating residues from petrochemicals, plastics, and pesticides that occupy cell receptor sites and block hormone utilization.

Consider the following statistics

- 400% increase in heart disease since 1900*
- 500% increase in cancer mortality since 1900*
- 250% increase in breast cancer since 1980*
- 59% decrease in male sperm count since 1940*
- 1600% increase in birth defects since 1980*
- More than 95% of cancer is caused by environmental toxicity and diet

The average city water contains more than 500 chemicals

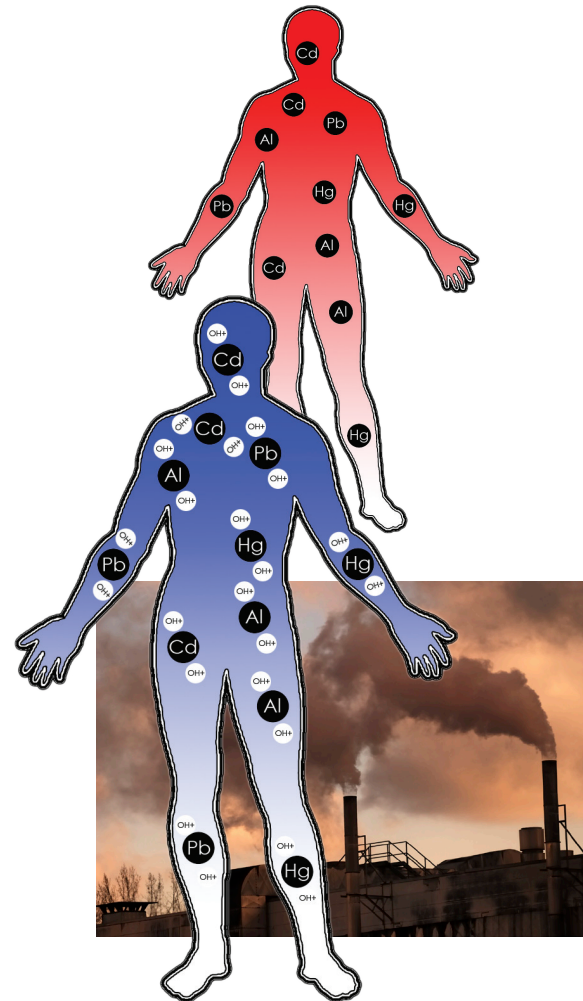

Source – USA Today

Multiple studies show that most of us have between 300-800 chemical residues stored in the fat cells of our bodies

Pesticide residues are detectable in 50-95% of the food consumed in the U.S

*National Center for Disease Control and Prevention – Center for health Solutions

Toxins damage cells, disrupt our endocrine systems, and impair the body's ability to absorb nutrients and heal itself. The body cannot metabolize most of the poisons to which it is exposed. Most of these toxins remain in the body for many years, stored in the fat cells that exist throughout the body.
