

TECH NOTE

SEPTEMBER 2018

Dear Fellow Model A'er,

My name is Claude Folta, a MAFCA member and a Model A owner for more years than I can count.

The purpose of this letter is to introduce you and your Model A club members to a new product for the Model A. The product is the "No-Foot-Starter". *It is a solenoid starter switch system that I developed for the Model A Ford that is totally unique.*

Sometimes it becomes more difficult to reach the floor mounted starter switch. If the car stalls on a hill or at a light you must grab the hand brake, remove your foot from the brake and fumble to find the starter. The safety and convenience of a push button starter switch cannot be over stated.

People have been installing solenoids on Model A's for years and they work very well. The problem with installing a solenoid is that it requires a certain amount of skill. You also must make permanent modifications to the car such as drilling holes in the body, frame or dash. Then finding the right switch and extra battery cables can be very time consuming.

The "No Foot Starter" is a starting system that anyone can install in about an hour. There are no holes to drill. The mounting is accomplished using existing holes and hardware. It uses the stock battery cable. No extra battery cable is employed. It uses a single wire connected to the hidden switch under the dash. A special designed bracket to mount the switch using existing fasteners is all that is required. It can be used on both 6 volt and 12 volt cars.

It works great, is easy to install and looks good under the hood. The wife of one of my customers said that is was the best thing he added to his car since air conditioning.

Call or email me. I would like to talk to you about this product. I'm sure there are members of your club that could use it and would be interested.

Take a minute to look at my website. www.trisisdesign.com

Claude Folta,
