To whom it may concern:

I am complimented that Screen Builders is being considered to manufacture Chuck Russillo's patented "structural foam panel system" used for walls, roofs, floors and USA country border walls. The panels are to be constructed with an aeronautical aluminum alloy framing and patented insulated foam keeping the weight light and ultra strong. I and my business partner, Bob Demarco, built a prototype panel for manufacturing feasibility. The panel is in a progressive manufacturing line keeping the production flow moving at a consistent speed.

Screen Builders is being considered as the manufacturer since we build multiple extruded aluminum structures of another type daily. The foam/aluminum structure manufacturing line will have a beginning point pulling the aluminum frame from the inventory racks, cutting to size and eventually assembled with foam. The process is simple and swift.

The finished modular panels are easy to handle and packed for shipping, light weight for air transportation and at the destination arrival, they will quickly connect with the least amount of physical work using simple tools. The jobsite assembly will be quick by accomplishing construction feats in much less time compared to conventional construction. This new building construction type will be the *new wave for building* residential houses, commercial buildings, warfare "bullet & shrapnel defensive" buildings for combat soldier housing-buildings, housing for weather destruction victims (Haitti, Japan and tornado areas), electrified border foam walls and prisons. When a structure is in a high hurricane/typhoon wind area, this is a solution for severe wind load building due to its superior foam strength.

The method of the construction for the new structural foam panel system will be at the greatest strengths known for building since the patented foam is rated at a strength that is off of the chart. Light weight, fast modular assembly in the field and super strong is the ultimate goal for sound building. The new structural foam panel system is the solution.

Michael Sonsini, Owner of Screen Builders
