

- *Graza is a fast growing, drought tolerant radish which can be grazed multiple times as it rapidly regrows after grazing.*
- *During summer when weight gains are difficult, Graza offers a palatable solution to the effects of cool season pastures.*
- *Graza survives hot, wet summers and can persist for a year without flowering in Oregon and Louisiana. This provides a whole new dimension to pastoral farming.*
- *After 17 years of crossing, this radish has evolved into a uniquely smooth-leaved, low-crowned and late-flowering crop. Graza's palatability, yield and quality under grazing compares favourably with the typically-used leafy turnips.*

This radish has a remarkable digestible dry matter and metabolizable energy level, higher than corn or sorghums.

Graza is a cost effective cultivar to grow, easy to sow and quick to germinate. It also does not need special tillage or planting equipment as it's easy to drill into stubble.

A major advantage of Graza is its persistence, resulting in more grazing cycles.

Sowing Guide

- Seed at 7-10 lbs/acre, as a pure stand.
- 6-8 weeks maturity required before first time grazing.
- Capable of 2-4 grazings.
- Compatible with chicory, herbs, plantain.
- Minimal ripening required.
- Can be spring or fall sown.

Suitability
