

"Earth Nurture has received an honourable mention in an innovation competition by the organization, "Think Beyond Plastic." I believe that if the ability to compete on price with conventional plastics had been a criterion for winning, Earth Nurture would have won first place.

Earth Nurture Additive (ENA) has been proved to cause rapid biodegradation of conventional plastics blended with ENA in both landfill and composting environments. More than 98% of all of the 300 million tons of plastic made every year is non-compostable, so ENA is a revolutionary step towards eliminating plastic pollution.

We have obtained full funding for complete ASTM D6400 / EN 13432 testing of ENA treated PE, PP, PS, and PET, and we have a manufacturing and distribution chain in place. ENA treated conventional polymers cost dramatically less than intrinsically compostable and biodegradable plastics currently available, so ENA offers an immediate, affordable solution to the plastic pollution problem. ENA is easily added to conventional plastics by pellet addition, just like other additives used in conventional plastics. Earth Nurture's long range plans include putting 30 to 70% renewable content into disposable plastic items treated with ENA, while keeping the prices of the end products readily affordable."

Greetings and best regards
