

DRUG FACT SHEET

Methamphetamines

High doses of methamphetamines can elevate body temperature to dangerous and sometimes lethal levels, as well as cause convulsions.

Class of drug:	Psychostimulant
Main active ingredient:	It is a derivative of amphetamine. Over-the-counter drugs containing ephedrine or pseudoephedrine and other materials are cooked in clandestine laboratories inexpensively to produce the drug.
What it looks like:	White powder, pills or a rock which resembles a block. The white powder is odorless, bitter-tasting and dissolves in water or alcohol.
Street names:	There are more than 300 street names including Crank, Crystal Meth, Crystal, Ice, Speed
How it is used:	Orally, injected, inhaled or smoked. It is also a Schedule II stimulant. There are few accepted medical reasons for its use.
Duration of high:	An initial, intense rush lasts from five to 30 minutes for most methamphetamines smoked or injected. Oral ingestion or snorting produces effects in three to 15 minutes. The effects of methamphetamines can last up to 12 hours or more.
Withdrawal symptoms:	Depression, fatigue, aggression and paranoia
Detection in the body:	Up to five days
Effects:	Immediate —increased activity, decreased appetite, euphoria, increased respiration, elevated body temperature Long-term —addiction, violent behavior, anxiety, insomnia, stroke, weight loss, paranoia, hallucinations, delusions, toxic effects on the brain Long-term —sleep problems, heart and kidney failure, brain damage, paranoia, coma, death

Methamphetamines are most often used in a “binge and crash” pattern where users repeatedly take more to try to maintain the high. Dependence occurs swiftly.

Illinois information

According to the U.S. Department of Justice, meth is the primary drug threat to central and southern Illinois but is increasing in the Chicago area. The state ranks fourth in meth-related arrests. In 2011, 2.6 percent of high school students in Illinois reported using meth at least once in their life.
