

Check Security Features

Void Pantograph

Void pantograph is also known as "hidden word" technology. This feature makes it extremely difficult for counterfeiters to reproduce checks or documents on color copiers or scanners. The word "VOID" appears when copied or scanned.

Micro Print Signature Lines

Commonly used in signature lines and borders. We utilize a special type font and size so the microprint line is clearly readable under magnification, but will become blurred and unreadable when copied or scanned.

Bleed Through Numbering

Prints in black or red and will penetrate the paper to create an image of the number on the back of the sheet. This image cannot be lifted or altered. Authenticity of a document can easily be verified without the use of any special agents. This feature can be used for both MICR and Arabic numbering.

Warning Borders

This feature alerts the bank and recipient of the document that security features are present. The border often defines some, but usually not all of the security features incorporated within the document.

Padlock Icon

A universal symbol within the check printing industry. It is used to identify and define the multiple security features used on a specific check.
