## Multiple Sclerosis: The Advanced Curriculum

Expert Insight Into:

### Subgroup Analyses of Placebo-Controlled Trial with an Oral Immunomodulator for the Treatment of RRMS (Part 2 of Series)

Based on the Article:

**Relapse and Disability Outcomes in Patients with Multiple Sclerosis Treated with Fingolimod: Subgroup Analyses of the Double-Blind, Randomised, Placebo-Controlled FREEDOMS Study.** Lancet Neurol. 2012;11(5):420-428.

(Course MS05.02)

Published on August 30, 2012 Article Review

**Expert Faculty:** Aaron E. Miller, MD  
**Medical Writer:** Carol Gorman, MS

[Overview](#) | [Faculty](#)

Subgroup analyses can provide valuable insights into appropriate treatment strategies based on a patient's baseline characteristics. Join Dr. Aaron E. Miller as he discusses the findings of subgroup analyses from a pivotal phase 3 trial for the first orally administered, disease-modifying therapy for relapsing-remitting multiple sclerosis (RRMS), and the implications of these results for the management of RRMS.

**Teva Neuroscience**

Additional grant support from  
Novartis Pharmaceuticals  
Corporation, Allergan, and  
Bayer HealthCare

### Poll Question

In patients treated with fingolimod 0.5 mg, the greatest annualized relapse rate (ARR) reduction among subgroups defined by baseline disease characteristics is seen in which group?

- ☐ Patients who had experienced  $\leq 1$  relapse in the year before the study
- ☐ Patients who had experienced  $> 1$  relapse in the year before the study
- ☐ Patients who had a baseline Expanded Disability Status Scale (EDSS) score of 0-3.5 points
- ☐ Patients who had a baseline EDSS score of  $> 3.5$  points

Submit
