

Safety

Safety is an important aspect of all our operations and one that is taken very seriously. AZ Dronography will not conduct operations for one party to gather information about another party. We carefully plan each flight in advance to focus on aerial photos or videos of the subject of interest in order to maintain the privacy of others. All of our flights are conducted over property where we have the landowner's permission. If our crew does not feel that the operation is safe, we maintain the right to postpone the service until a later date or until the problem(s) are rectified

Our UAS has built in failsafe procedures to ensure that the system is as safe as possible during operation. These procedures include a return home function, which directs the UAS back to the takeoff location during signal interference and transmitter failure. The system will also land itself if the battery discharges to a certain value. The return home function can be activated at instantly in case of emergency.
