

Gilbert Proulx, Ph.D.

I am interested in wildlife ecology and management, and I am specialized in mammalogy. In the past, I have studied populations and habitats of ungulates, rodents and carnivores in North America. I have also tracked mammals in Africa, South America and Asia. I am a field-oriented scientist, and my activities focus on forest and agriculture ecosystems: i) searching solutions to conflicts between humans and wildlife; ii) studying the habitat requirements of species at risk and species of economic importance; iii) developing new technology to capture and study animals; and iv) producing textbooks, field guides, and educational material for the public, wildlife professionals and managers.
