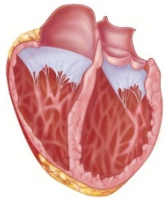
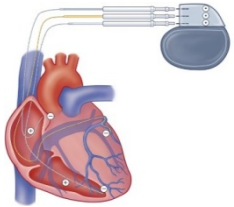
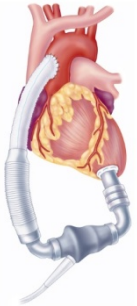
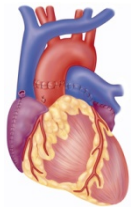
CURRENT THERAPEUTIC OPTIONS

Class I, II, & III → Class III → Class IV









Medications
- ACE inhibitors/ARBs
- Beta-blockers
- Aldosterone antagonists
- Diuretics and nitrates
- Ivabradine (AMGEN)
- Entresto (Novartis)

Devices
- Bi-V pacemakers + defibrillators (CRT-D)

Hemodynamic Support
- IV inotropes
- LVAD

Transplantation
- Immuno-suppression

LVADs and heart transplants used in late-stage HF patients can cost $150,000 per procedure

Regenerative therapy is advocated as a new avenue in the treatment\ of NYHA HF class II-IV Heart Failure

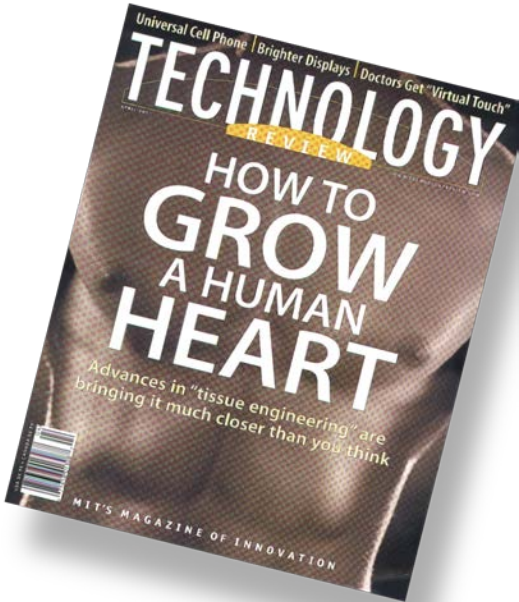
Interventions: Drug: Granulocyte-colony stimulating factor; Procedure: Percutaneous intracoronary injection;

The Promise of CardioVascular Stem Cell Therapy

Use of stem cells for myocardial and/or vascular regeneration

- NeoAngiogenesis (new vessel formation)
- NeoMyogenesis (new cardiac muscle formation)
- Myocardial ‘salvage’ (only significant in Acute Myocardial Infarction)
  - *reduction of ischemia/ hypoxic damage*
  - *reduction of inflammation*
  - *reduction of oxidative stress (reperfusion injury)*
  - *resident cells more resistant to cell death (pAkt/ Bax/ Bad)*
- Reduced adverse cardiac remodeling on long term
  - *potentially secondary to former beneficial effects*

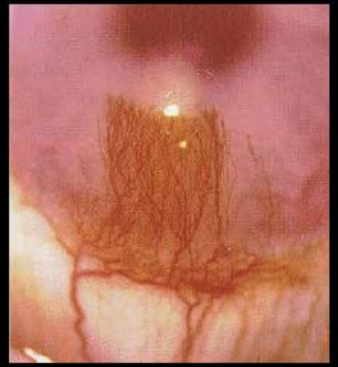


The Promise of CardioVascular Stem Cell Therapy

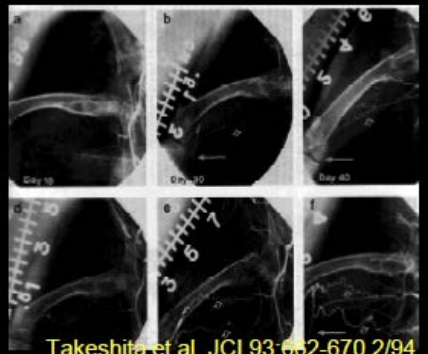
Neoangiogenesis has been demonstrated in numerous in vitro and in vivo models

Chick Allantoic Membrane

Rabbit Cornea

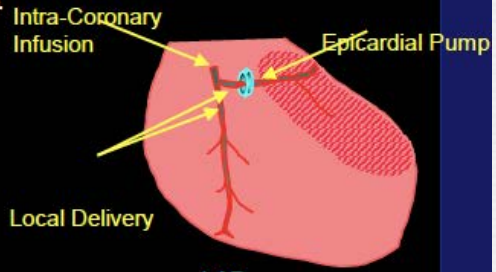


Rabbit Hindlimb



Takeshita et al. JCI 93:662-670 2/94

Ameroid Pig Heart



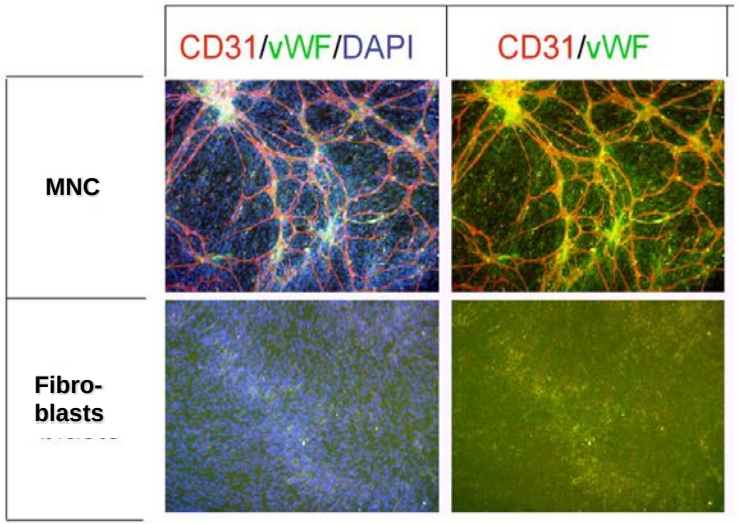
Plasticity of human bone marrow stem cells

differentiation into endothelial cells in vitro and *in vivo*

in vitro

(2D MatriGel)

Formation of neo vessels in culture dish



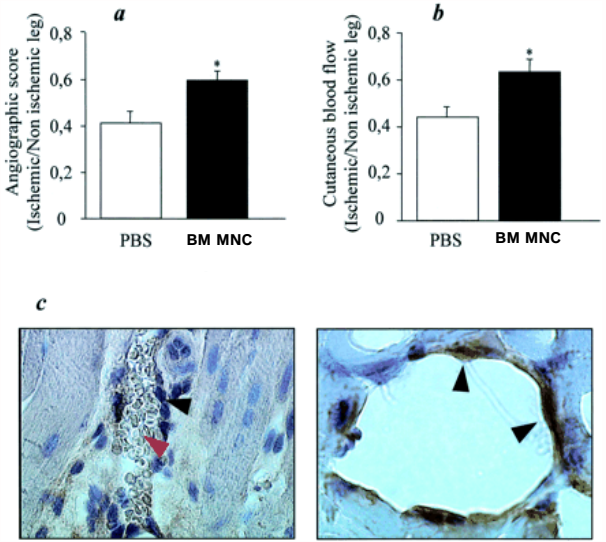
BM MNC (top row) in a tube formation assay
fibroblasts (bottom row) were used as a control.

Rutenberg et al.

in vivo

(mouse hind limb ischemia model)

Formation of new vessels in ischemic limb

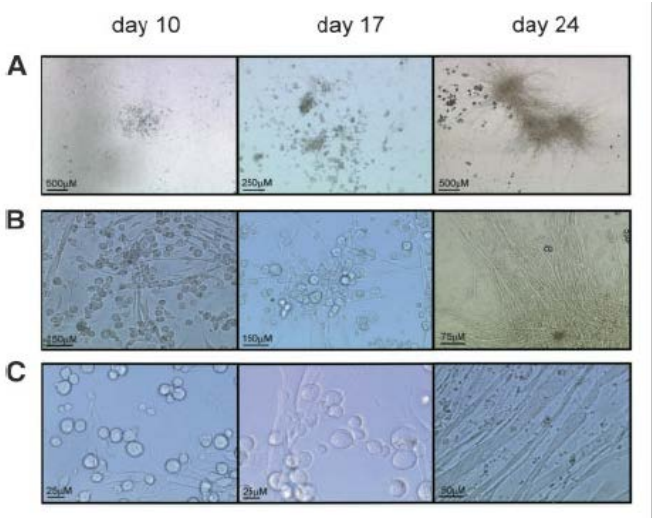


Incorporation of (beta Gal ~ purple) stem cells
in newly formed vessels in the mouse limb

Planat-Benard et al., Circulation (2004)

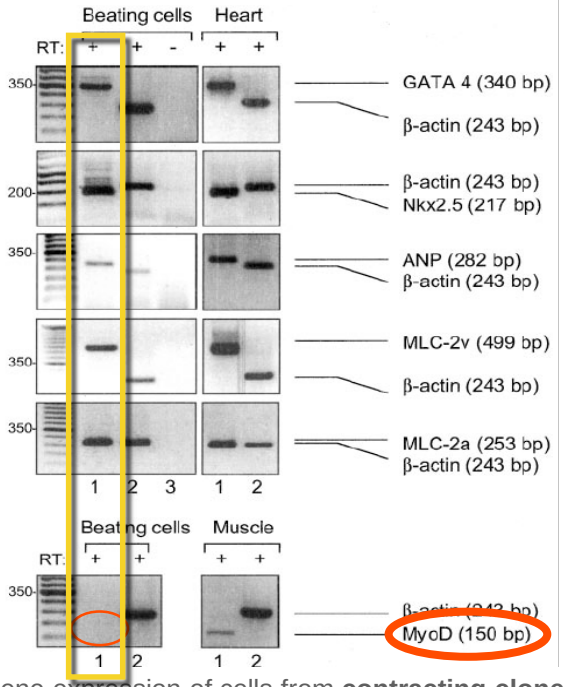
Plasticity of human bone marrow stem cells

differentiation into cardiomyocytes in vitro



Phased-contrast microscopy of contracting clones
Isolated BM MNC plated into methylcellulose
Rounded cells becomes elongated and finally aligned and branched myofibrils are seen.

Reverse transcription polymerase chain reaction analysis



Gene expression of cells from **contracting clones** was compared with control cells from **mouse heart muscle**. Absence of MyoD demonstrate BM MNC are **not skeletal muscle** cells.

Planat-Benard V. Circ. Res. 2004;94;223-229
Léobon et al, Cardiovasc Res. 2009 Sep 1;83(4)

Bone marrow stem cells are cytokine factories

Lessons from clinical cell therapy studies

Table 3 Summary of clinical outcomes

Outcome	No. of trials	Time point measure[a]	Relative risk (95% CI)	P-value
Mortality	5	1–12 months	0.62 (0.22, 1.76)	0.37
Morbidity				
Re-infarction	7[b]	<30 days (1)	0.33 (0.01, 7.81)	0.49
		1–4 months (4)	0.61 (0.12, 2.96)	0.54
		12 months (1)	0.08 (0.00, 1.37)	0.08
Arrhythmias	1	Not known	0.57 (0.21, 1.53)	NA
Restenosis	7[b]	6 months (5)	1.10 (0.68, 1.80)	0.69
		12 months (1)	0.34 (0.01, 8.13)	0.51
Re-admission	4[b]	1–6 months (2)	0.61 (0.25, 1.52)	0.29
		12 months (1)	0.15 (0.01, 2.78)	0.2
Revascularization	6[b]	1–6 months (2)	0.55 (0.19, 1.62)	0.28
		12 months (1)	0.71 (0.42, 1.20)	0.2
Adverse events	5[c]	Not reported in all studies	NA	NA
Quality of life	2	21 day–6 months	Not measured	NA
Re-operation	1	12 months	0.61 (0.39, 0.95)	NA

NA, not applicable.
[a]Number of trials that measured the outcome at each time point is in brackets.
[b]One study did not report the time point at which the outcome was measured.
[c]Adverse events not always reported in full details to allow statistical analysis.

Meta analysis of 14 RCT with BM MNC in AMI (n=811 pts)

improvement of clinical end points is suggested:
- re-AMI
- re-admission due to CHF
- revascularization
- no effect on mortality/ morbidity

- Dose-dependent relationship is suggested between BMSC and effect on LVEF
- Suggestion of improvement of diastolic (dys)function as well

- increase of ~3% LVEF
- reduction of ventricular volumes
- reduction of infarct size of 3.5-5.6%
- improved regional function

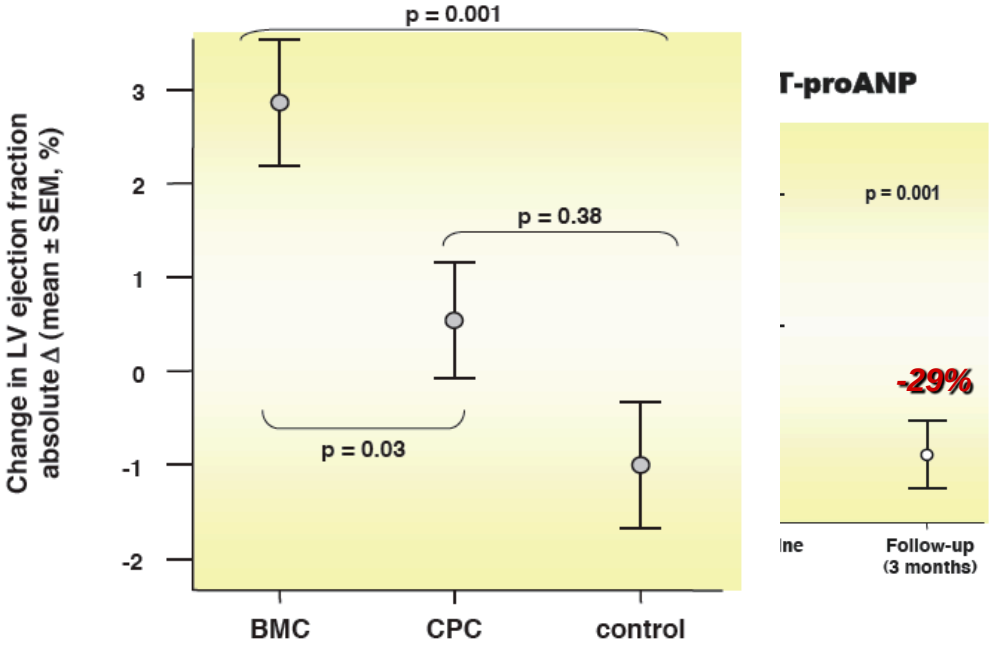
Moderate Improved LV EF after BMC therapy in patients with chronic heart failure

TOPCARE-CHD



MRI subanalysis of 35 pts demonstrated

- improvement of regional LV contractile function (number hypocontractile segments)
- no change in infarct size

n=28 pts n=24 pts n=23 pts

n=97 pts

Assmus et al, NEJM 2006; 355
Assmus et al, Circ Res 2007; 100

The small number of patients without contraindications for MRI (n=17) precluded performing an informative analysis on the MRI data. There were no significant differences in the change between the 2 groups in regional wall motion (–0.1 [95% CI, –0.30 to 0.14]; *P*=.47) and LV end-diastolic volume index (2.5 [95% CI, –4.4 to 9.3]; *P*=.48).

Forty percent of patients in the BMC group and 47% of patients in the placebo group were NYHA class III at baseline. The decrease over time in the percentage of patients in the BMC group who were NYHA class III was statistically significant (40% vs 20%; for difference: 95% CI, 3% to 37%; *P*=.02); there was no significant difference in the analogous change for the placebo group. However, when the between-group analysis was applied, this finding was not statistically significant. Similarly, there were no significant differences in the change in CCS class (difference in the percent change: 0.18 [95% CI, –0.07 to 0.43];

Findings for stroke volume were similar, with a mean (SD) increase of 2.7 (12.9) mL in the BMC group and a decrease of –5.8 (15.2) mL in the placebo group; this difference was significant (8.4 [95% CI, 2.1 to 14.8]; *P*=.01).

In an exploratory analysis, BMC therapy was associated with an improvement in maximal oxygen consumption for patients with number of endothelial colony-forming cells greater than the median value of 80 (change: 2.5 [95% CI, 0.16 to 4.88]). However the interaction test for this assessment was not significant (interaction effect size: 2.61 [95% CI, –0.30 to 5.51]; *P*=.08).

A regression analysis showed that higher CD34 cell or CD133 cell counts were associated with greater absolute unit increase in LVEF. The range of CD34 was 0.5% to 6.9% (SD, 1.2%). Assuming that differences of 1.96 for SD or 2.4% are more likely due to biological variability, the effect of differences in CD34 cell level beyond that expected due to natural variability was examined, using a 3% level to be conservative. Every 3% higher level of CD34 cells was associated with on average a 3.0% greater absolute unit increase in LVEF in a multiple variable model that included age and treatment as predictor variables (3.06 [95% CI, 0.14-5.98]; *P*=.04). An analogous computation for CD133 cells (range, 0.1%-3.6%; SD=0.62) revealed that every 3% higher level of CD133 cells was associated with on average a 5.9% greater absolute unit increase in LVEF (5.94% [95% CI, 0.35%-7.57%]; *P*=.04).

Table 1. Patient Baseline Characteristics

	BMC Group (n = 61)	Placebo Group (n = 31)	*P* Value
Mean (SD) Age, y	63.95 (10.90)	62.32 (8.25)	.47

With a low dose of BM MNC

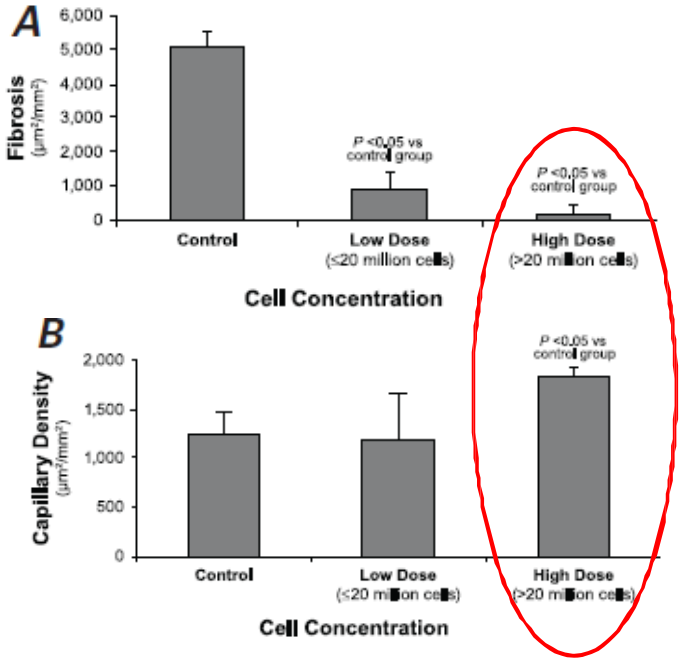
(NOGA delivery catheter - 100 Mill BM MNC)

BIOCARDIA

Perin, EC *et al. JAMA 2012, 307(16), pg 418*

Bone marrow Cells – Preclinical Experience (Pig)

Dose Dependence: Higher dose of MNC led to less fibrosis and increased microvessel formation in infarcted pig myocardium 60 days after treatment



Reduced Fibrosis

>100 Million BMC resulted in less fibrosis

Increased Capillary Density

200 Million BMC (>20 Million BMC/segment) resulted in highest capillary density and least fibrosis

Cochrane Database of Systematic Reviews

Stem cell therapy for chronic ischaemic heart disease and congestive heart failure (Review)

Fisher SA, Brunskill SJ, Doree C, Mathur A, Taggart DP, Martin-Rendon E

Cochrane Database of Systematic Reviews 2014, Issue 4. Art. No.: CD007888.

Main results

We include 23 RCTs involving 1255 participants in this review. Risk of bias was generally low, with the majority of studies reporting appropriate methods of randomisation and blinding, Autologous bone marrow stem cell treatment reduced the incidence of mortality

At >12 month follow-up

- ✓ Reduced Mortality (P=0,0001)
- ✓ Reduced hospitalization due to Heart Failure (P=0,04; MACE-HF)
- ✓ Reduction in Left Ventricular Systolic Volume (P<0,00001)
- ✓ Improvement of Left Ventricular Ejection Fraction (P=0,02)
- ✓ Improvement Stroke Volume Index (P=0,01)
- ✓ Improvement of NYHA functional Heart Failure Class (P=0,0002) and CCS score (P=0,03)
- ✓ Trends were also seen at short term follow-up (4-6 months)
- ✓ Only 4 Adverse Events in 19 RCT of the meta analysis

BMSC were administered following acute myocardial infarction (AMI), we found some evidence for a potential beneficial clinical effect in terms of mortality and performance status in the long term (after at least one year) in people who suffer from chronic IHD and heart

Fischer *et al., Cochrane Database of Systematic Reviews* 2014, Issue 4.

Initial Experience with Stem Cell Therapy in Heart Failure Patients

- improvement in LVEF
- reduction of adverse remodeling
- Reduced NYHA and CCS HF class
- reduced MACE HF events (rehospitalizations, HTx, LVAD)
- improved survival

- excellent safety profile
- no arrhythmias or other cell-related mortality/ morbidity

CardiAMP: Phase II Trial Design

Transendocardial Autologous Cells in Heart Failure Trial
(TAC-HFT, 2007 – 2013)

Primary Endpoints

- **Incidence of any treatment emergent serious adverse events at 30 days FU**
  - Death, non-fatal MI, stroke, hospitalization due to worsening HF, perforation, tamponade

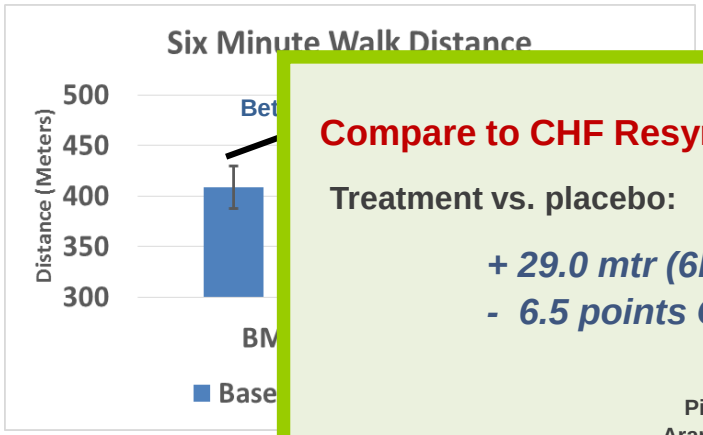
Secondary Efficacy Endpoints at 6 and 12 months FU

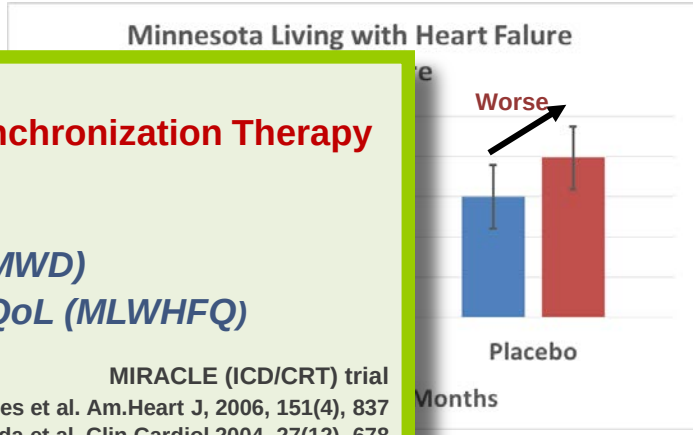
- New York Heart Association (NYHA) heart failure class
- Minnesota Living with Heart Failure quality-of-life questionnaire
- Peak oxygen consumption (VO_2max)
- Six minute walking distance
- Cardiac imaging endpoints (CMR, MSCT, 2D TTE)
  - Infarct Size
  - Regional wall motion at injection sites
  - Global LV size and function

    Using cardiac magnetic resonance imaging, MSCT, 2D transthoracic echocardiography

Phase II TAC-HFT - BMC

- **Primary safety endpoint:** No treatment emergent SAE at 30 days FU
- **Secondary efficacy endpoints:**





Compare to CHF Resynchronization Therapy

Treatment vs. placebo:

+ 29.0 mtr (6MWD)

- 6.5 points QoL (MLWHFQ)

MIRACLE (ICD/CRT) trial

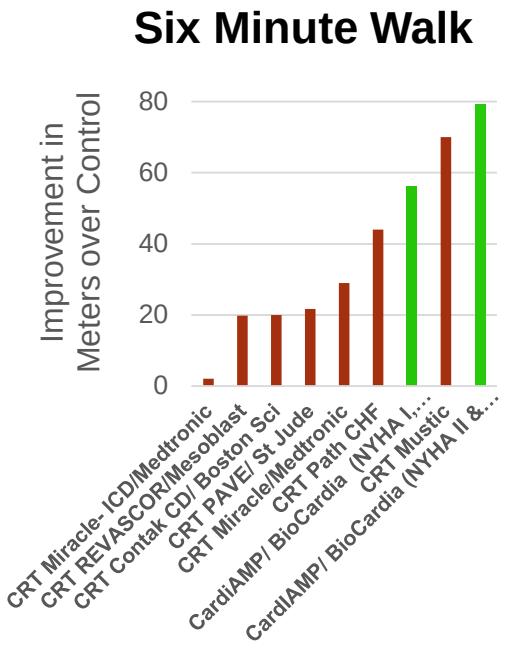
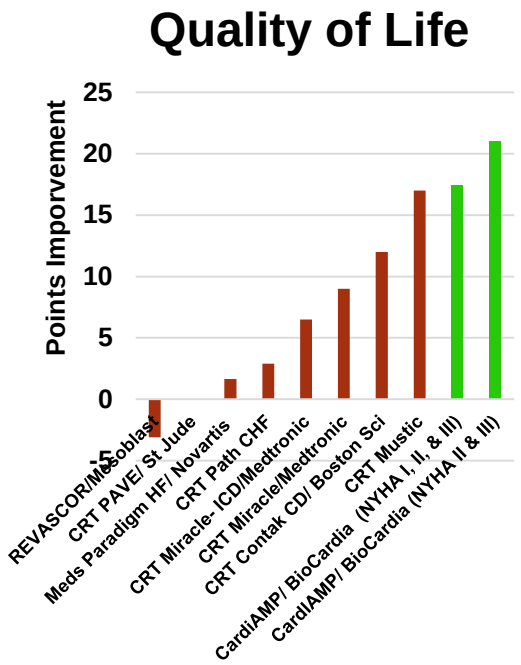
Notes:										
(1) This eliminates NYHA Class I patients (15, 29, 31, 54, and 67 in the CardiAMP cell therapy group 5/19, and 22, 28, and 63 in placebo group 3/10).										
(2) Note: patient 31 is lost to followup on much of previous analysis as only BL values available. Thus, seven patients excluded in this analysis w/ NYHA Class I.										
(3) Placebo patient 53 Imputation of worst observation carried forward due to stroke before 6 months, has a more significant effect in this analysis due to smaller N.										
(4) T Tests are one tailed, two sample, with assumed hemoscedastic distribution										

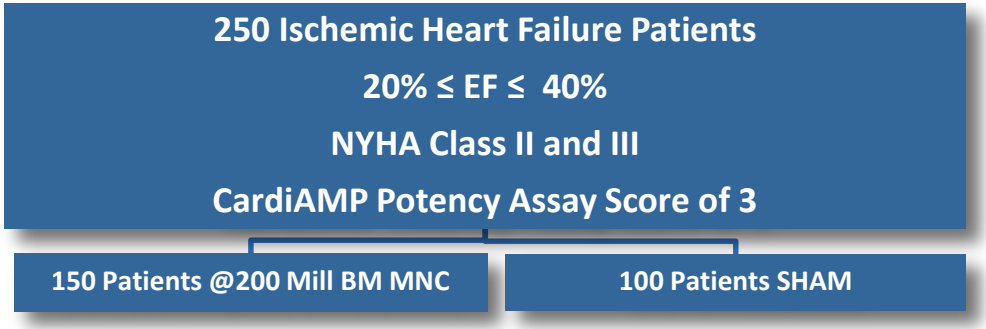
CardiAMP Data Relative to Peers (NYHA class II-III)

- Superior six minute Walk (6MW) and Quality of Life (QOL) as compared to CRT
- Superior 6MW and QOL to Mesoblast Revascor Phase II, with more consistent
- Superior QOL to that of Novartis Entresto, which does not report out 6MW





Phase III CardiAMP HF clinical Trial



- **Changes from Phase II:**
  - ☑ NYHA Class I patients are not included
  - ☑ potency assay is implemented to enhance response to therapy
- **Primary endpoint:**
  - Superiority with respect to functional capacity as measured by six minute walk test at one-year post-procedure (efficacy) ; achieved in Phase II
- **Secondary hierarchical endpoints:**
  - Non-inferiority with respect to survival (safety)
  - Non-inferiority with respect to MACE (safety)
  - Superiority with regard to quality of life as measured by the MLHFQ
  - Time to first heart failure (HF)-related major adverse cardiac events (efficacy)
  - Superiority with respect to survival (efficacy)

Achieved in Phase II

CardiAMP HF Trial Study Design

Study Design

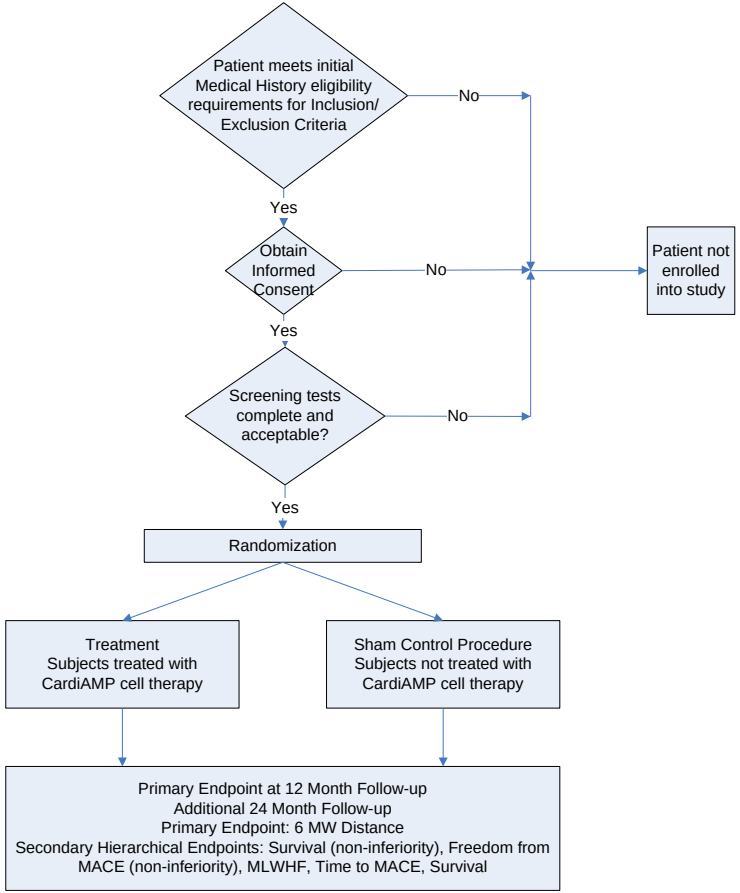
Prospective, multi-centered, 3:2 randomized, controlled, double-blinded phase III clinical trial to assess CardiAMP cell therapy in 260 patients with post-infarction heart failure.

Treatment Group: 160 Subjects treated with autologous BM MNC using the CardiAMP cell therapy and optimal medical therapy

Sham Control Group: 100 Subjects treated with optimal medical therapy

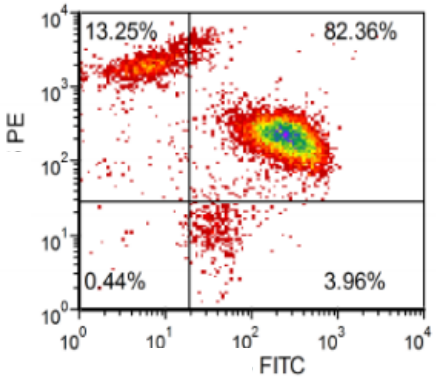
Roll-in Phase: Maximum of 10 subjects

Total Number of Patients: 260 subjects

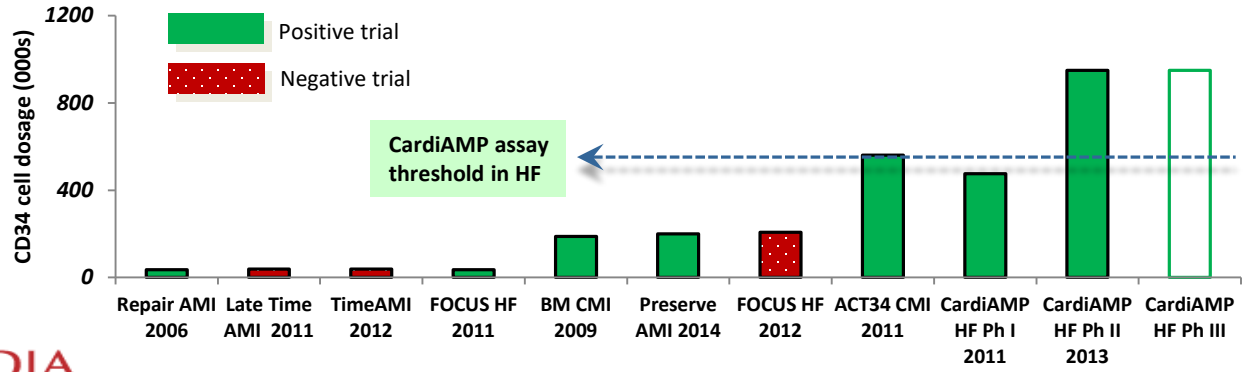


CardiAMP HF: Pre-procedure Marrow Potency Assay

- Biomarkers identified in previous BioCardia trials and the literature shown to correlate independently with efficacy of CV cell therapy
- Bone marrow sample 1-2 weeks before planned treatment. Proprietary Biomarker Analysis at Central Core Lab to assess presence of bone marrow characteristics associated with myocardial repair (flow cytometry and cell biology)
- Potency Assay ensures appropriate function and (sufficient high) titer of BM cells
- One of the markers is the CD34+ cell titer in the bone marrow



Estimated effective CD34+ cell dosage from leading trials

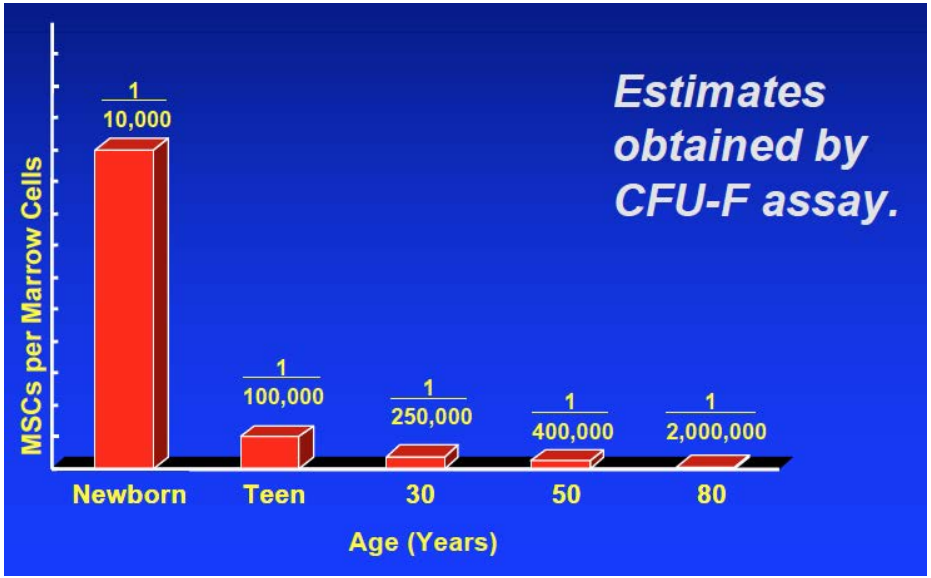


BIOCARDIA

Modified from Wong et al : International Conference on Cell Therapy for Cardiovascular Disease 2014

Autologous Stem Cell Therapy

- **naturally occurring variability in cell functionality between patients (biovariability)**
- **functionality of BM MNC, EPCs and MSCs is impaired in patients with ischemic CMP and diabetes (but also aging, hypertension, hypercholesterolaemia) ~ “depleted or damaged”**



BM Stem Cells number and function reduced (CFU)

- **aging**
- **hypertension**
- **smoking**
- **hypercholesterolemia**
- **diabetes**
- **(ACE inhibition)**
- **(heparin)**

Appropriate action to promote graft efficacy ?

- **subculture cells**
- **pharmacotherapy**
- **selection of cells**
- **rejection of patient**

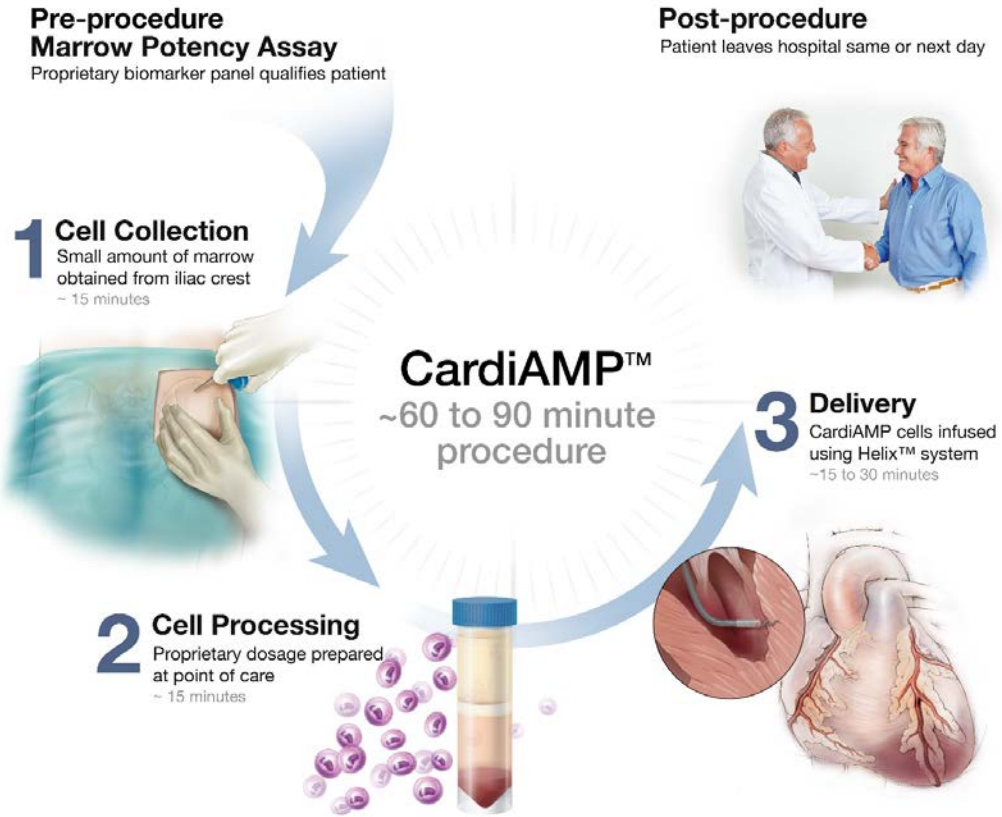
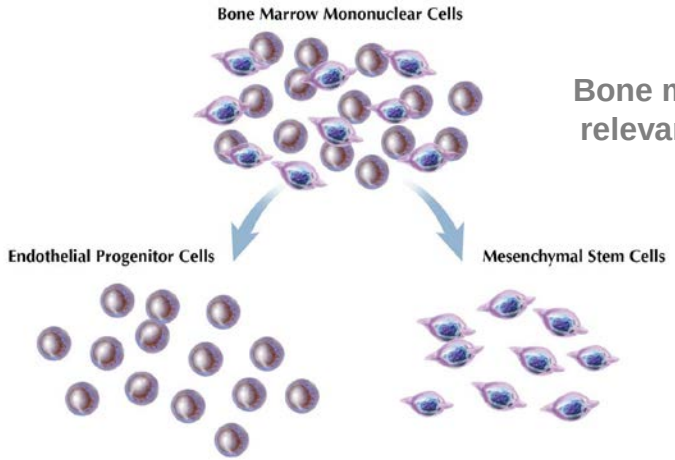
CardiAMP Step 2. The Stem Cell Harvest and Intramyocardial Delivery



BIOCARDIA

CardiAMP Procedure Step 1: Cell Collection

- **The clinician draws 60 cc of bone marrow from the iliac crest**
- **The procedure is performed under local anesthesia and conscious sedation and takes approximately 15 minutes**



Bone marrow contains several relevant stem cell populations

The Helix/Morph delivery device results in superior retention with a higher dose of delivered BM MNC

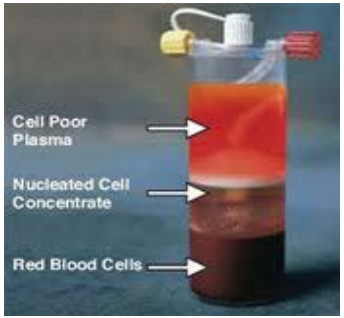
In CardiAMP HF trial patients receive 200 Mill MNC and 8-10 Mill CD34 cells (so dosing each of these functional sub populations at a therapeutic dose)

BIOCARDIA

Loffredo FS et al Stem Cell. 2011;8:389-98.

CardiAMP Procedure Step 2: Cell Processing

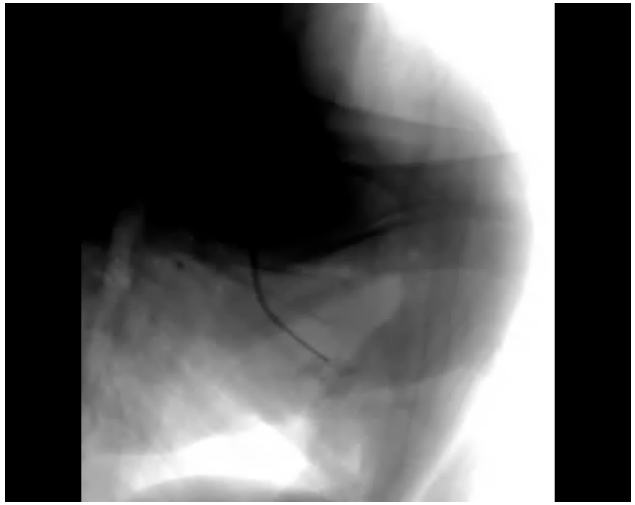
- The CardiAMP cell processing platform prepares the cell graft from the bone marrow sample using a proprietary point-of-care method
- The system includes a single-use, sterile, disposable separation tube that includes a density-tuned dual buoy separation system, designed for the isolation of BM nucleated cells
- Cells processing, while the patient is prepared for cell delivery, takes approximately 20 minutes

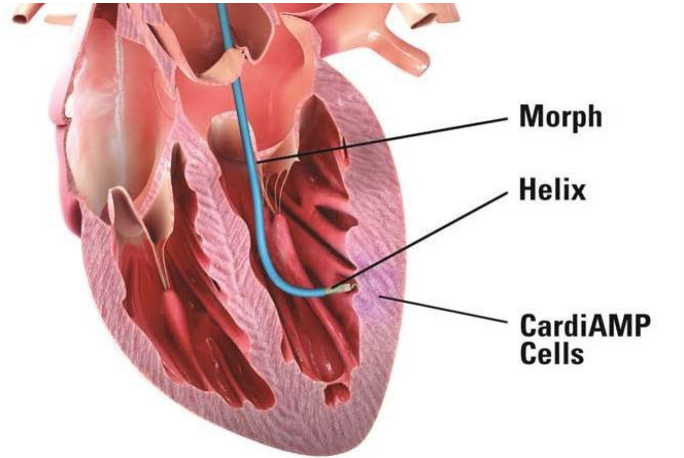


CardiAMP Procedure Step 3: Intramyocardial cell delivery

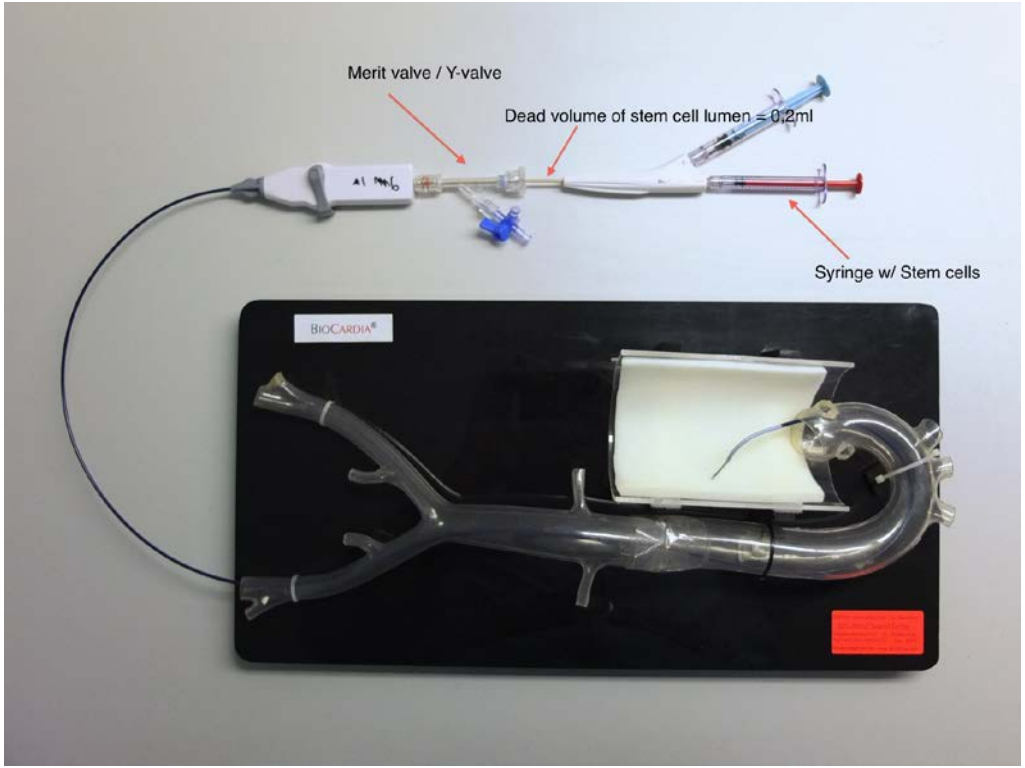
Intramyocardial injection of CardiAmp cell graft using the Helix system

- The CardiAMP cells are intramyocardially injected using the proprietary Helix percutaneous delivery system (10 injections of 0,5 cc)

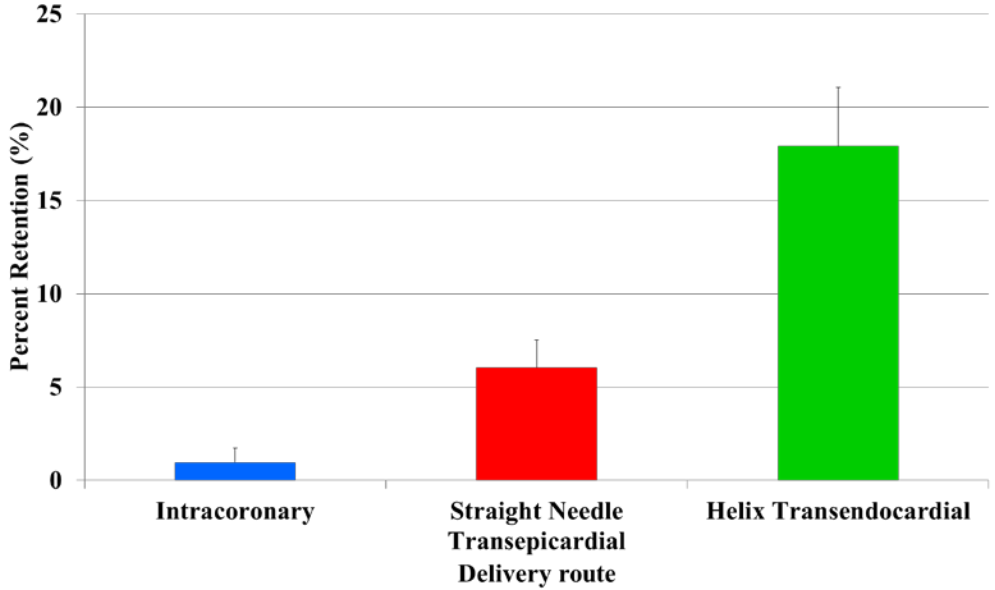




CardiAMP Procedure Step 3: Intramyocardial cell delivery



Increased efficiency of delivery increases effective dosage



Helical shaped needle in Helix/Morph delivery device results in superior myocardial retention and a higher effective dose of delivered BM MNC

In CardiAMP HF trial patients receive 200 Mill MNC and 8-10 Mill CD34 cells

Wong Po Foo, IC3D 2013.

CardiAMP Heart Failure Trial Study Design

Study Design

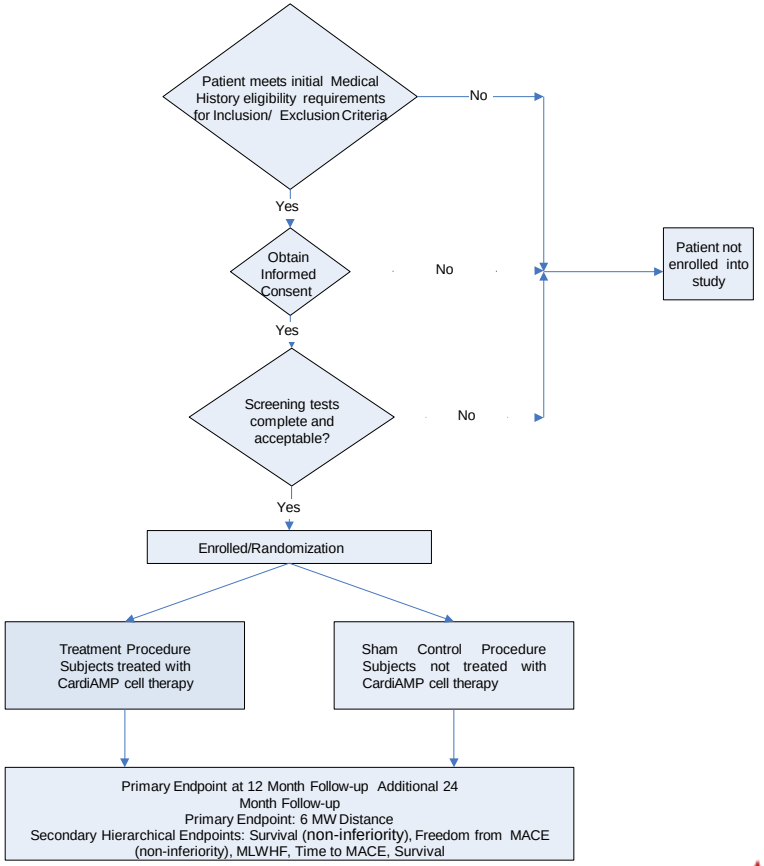
Prospective, multi-centered, 3:2 randomized, controlled, double-blinded phase III clinical trial to assess CardiAMP cell therapy in 260 patients with post-infarction heart failure.

Treatment Group: 160 Subjects treated with autologous BM MNC using the CardiAMP cell therapy and optimal medical therapy

Sham Control Group: 100 Subjects treated with optimal medical therapy

Roll-in Phase: Max of 10 subjects (completed)

Total Number of Patients: 260 subjects



Phase III CardiAMP committees

- **Executive Steering Committee/ ESC**
  - Carl Pepine – University of Florida (PI)
  - Amish Raval – University of Wisconsin (PI)
  - William Abraham - Ohio State University
  - Peter Johnston – Johns Hopkins Hospital
  - Jay Traverse – Minneapolis Heart Institute
  - Peter Altman – BioCardia
- **Data safety monitoring board/ DMSB**
  - 3 members (Int.card./ HF/ BioStat), undisclosed
- **Data adjudication committee/ CEC**
  - 3 members (Int.card./ HF), undisclosed
- **Core Laboratories**
  - Echocardiography — Yale Cardiovascular Research, New Haven (Lissa Sugeng)
  - Cell Analysis Lab — Center for Cell & Gene Therapy, Baylor Univ, Houston (Adrian Gee)

CardiAMP Heart Failure Trial

Inclusion Criteria

- New York Heart Association (NYHA) Class II or III
- Diagnosis of chronic left ventricular dysfunction, due to previous myocardial infarction (TTE)
- Left ventricular ejection fraction of 20 - 40% as determined by 2D/3D echocardiogram, and not in the setting of a recent ischemic event
- No recent MI within last 6 months
- Previous treatment with thrombolytic therapy, coronary artery bypass surgery, or percutaneous coronary revascularization
- On stable evidence-based medical and device therapy for heart failure, per the 2013 ACC/AHA Heart Failure guidelines, for at least 3M prior to randomization
  - Optimal pharmacotherapy (BB, ARB/ACE-I, diuretics, aldosteron.inh.)
  - Cardiac resynchronization therapy (CRT/ CRT-D) if appropriate
    - CRT or CRT-D implanted at least 3M prior to randomization
    - Eligible or anticipated to be eligible for CRT or CRT-D > 6M
- Cell Potency Assay Score of 3, as determined by the Cell Analysis Core Lab

CardiAMP Heart Failure Trial

Key Exclusion Criteria

- bronchospastic lung disease, orthopedic, muscular, or neurologic conditions that could limit the ability to perform the 6MWD Test
- Need for coronary artery revascularization. (PCI/CABG should occur at least 3 months prior to randomization)

- Severe mitral, tricuspid or aortic regurgitation (≥3+) ,
- Presence of aortic stenosis ((≥3+, AVA < 1.5 cm^2)

- mechanical aortic valve or heart constrictive device
- a life-threatening arrhythmia
- complete heart block or QTc interval >550 ms
- AICD firing in the past 60 days prior to the procedure

- peripheral artery disease involving the aorta or iliofemoral system that impacts the feasibility or safety of the study intervention.

CardiAMP Heart Failure Trial

Primary Endpoint at 12-months follow-up

- Change in 6-minute walking distance (6MWD)

Secondary Hierarchical Endpoints at 12-months follow-up

- Overall survival (non-inferiority outcome)
- Freedom from MACE (non-inferiority outcome)
- Change in Quality of Life as measured by Minnesota Living with Heart Failure (*superiority* outcome)
- Time to first MACE (*superiority* outcome)
- Overall survival (*superiority* outcome)

Additional Secondary Endpoints at 12-months follow-up

- Heart failure death
- Hospitalization due to exacerbation of heart failure
- All-cause hospitalization
- Days alive out-of-hospital
- Freedom from Serious Adverse Events
- NYHA Functional Class for Heart Failure
- Treatment-emergent Serious Adverse Events at 30-days follow-up
- Survival, at 24-months follow-up
- 6MWD repeated measure analysis
- Technical success, defined as successful percutaneous delivery of BM-MNC
- change in left ventricular ejection fraction, end systolic and end diastolic dimensions, and mitral regurgitation as analyzed by echocardiography (TTE)

BIOCARDIA®

CardiAMP HF stem cell therapy in Heart Failure

High Dose Autologous BM MNC Therapy by intramyocardial injection

Over the past decade, cell therapy has emerged as a new treatment of a variety of cardiac diseases, including chronic heart failure, refractory angina and AMI.

CardiAMP HF Therapy provides

- Harvest, isolation and delivery of autologous stem cells at point of care within 60-90 min
- Delivery of high dose BM MNC therapy at a target dose of 200 Million (8-10 Mill CD34 stem cells)
- Selection of suitable patients using a Cell Potency Assay (to verify potency of autologous BM cells)

The first results suggest

- Functional benefit of ~9 mtr (TAC HBT)
- Improvement of Quality of Life -21 pts (TAC HFT)
- Reduced NYHA HF classification
- Results of first 10 CardiAMP patients will be published in Circ.Res. (Johnston et al)
- CardiAMP HF Program will be initiated in next few weeks at Oklahoma Heart Institute

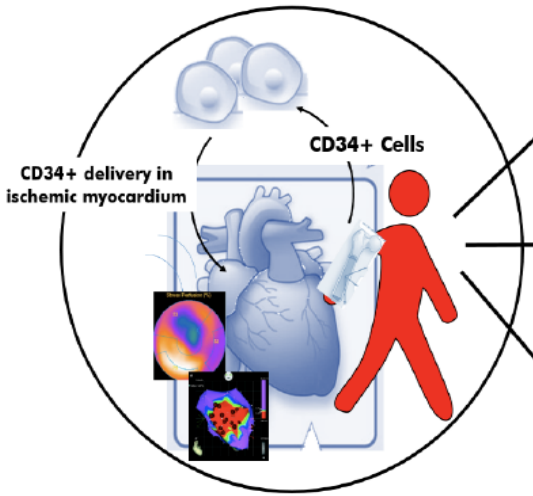
CD34+ Cell Therapy for Patients with Refractory Angina

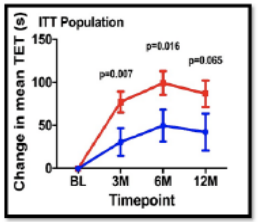
Improvement in exercise time, angina, and mortality compared to placebo

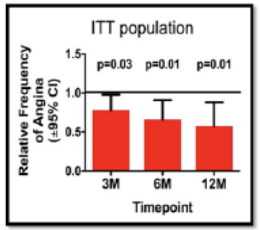


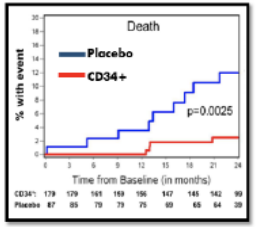
Improved total exercice time throughout the 3-12 month period on treadmill stress test

Lower relative frequency of angina throughout the 3-12 month period

Significant decrease in all-cause mortality at 24 months







RENEW protocol required 4 days of iv GCSF treatment, plasmapheresis and immune isolation (in a clean room facility) to generate a dose of 8 Mill CD34+ MNC Technology at hand allows one to generate this dose within 20-30 min in the Cath Lab

CardiAMP Chronic Myocardial Ischemia Trial Design

CardiAMP-CMI

Study Design

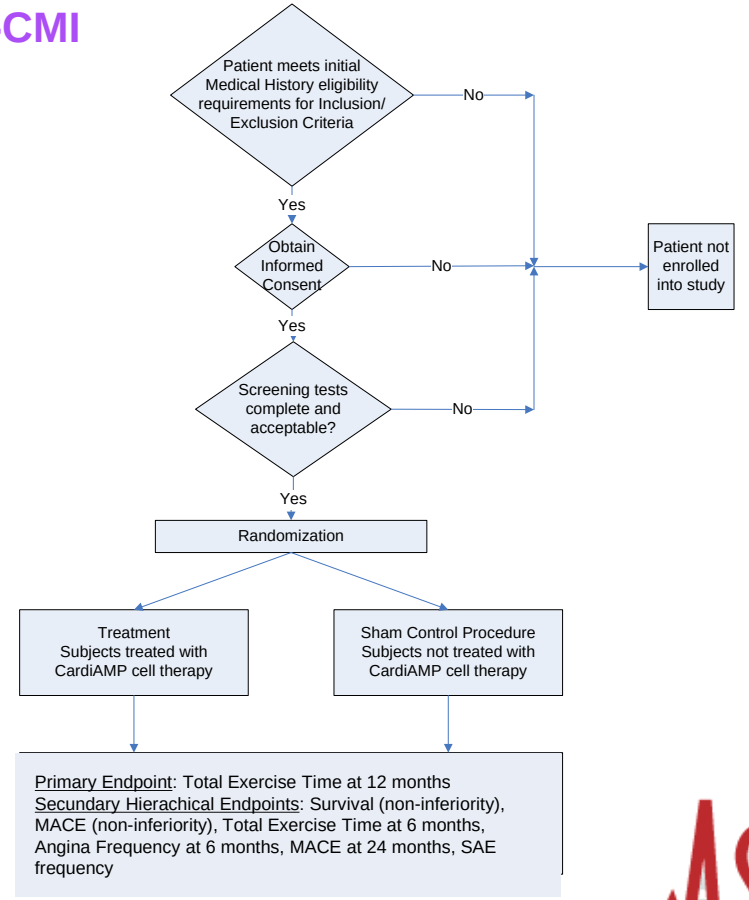
Prospective, multi-centered, 2:1 randomized, controlled, double-blinded phase III clinical trial to assess the effect of CardiAMP cell therapy in 343 patients with chronic myocardial ischemia/ refractory angina (CCS III-IV chronic refractory angina).

Treatment Group: 222 Subjects treated with autologous BM MNC using the CardiAMP cell therapy and optimal medical therapy

Sham Control Group: 111 Subjects treated with optimal medical therapy

Roll-in Phase: Maximum of 10 subjects

Total Number of Patients: 343 subjects



Thank you for your kind attention !
