RE: ENERGY AND COST REDUCTION PROJECT

Abbott Chemical Plant had an energy and cost reduction goal. In an effort to reduce the energy consumption we explore the opportunities offered by the new technology on lighting retrofit. As a benefit, upgrading our illumination system will be projected on operational cost reduction and increase the quality of light.

Transcon Lighting System was the company selected to perform a preliminary assessment after evaluated their experience and technical expertise. The energy conservation study provided key data on the existing system and the recommendation to improve it in order to determine the feasibility of the project.

Project consisted in the retrofit of 609 fixtures in the main office building with lamps reductions, electronic multivolt T8 ballast and a 95% specular aluminum reflector. Completion of the project was on December 2001 with projected savings in KWH of \$2,833.78/month with a return of investment of 79% in the first year.

The project was completed in a very safety, professional and high technical way within the due date. The group was flexible on time schedules and adopts high achievements to perform the project without affecting any operation in the plant.

Thanks.

Sincerely,

Pedro O. Méndez
Maintenance Engineer I
