---

If it has been determined that a Radon mitigation system needs to be installed in your unit, it is important that the following guide lines are followed.

Please inform the office that you plan to have this work done.

- 1 – All piping must be contained inside the unit.
- 2 – Exit pipe must be through the roof and pipe must be located in the rear of the roof.
- 3 – Exit pipe cannot be visible from front of building.
- 4 – Exit pipe must be painted black.
- 5 – Installer must be insured.
- 6 – Proper roof sealing is the responsibility of the unit owner – any leaks are the financial responsibility of the unit owner – roof repairs, if needed, are made by the Association roofer and billed to the unit owner.
