RESEARCH INTERESTS

My research using animal models focuses on the neurobiological mechanisms underlying memory formation, with an emphasis on neural circuits of emotion. This work is both significant and timely to research on sex differences in Post-Traumatic Stress Disorder and substance misuse. The objectives of my research program are to 1) tease apart the complex and integrative circuit mediating discrimination of cues signifying safety, fear or reward, and to 2) identify the neuronal correlates of the behavioral sex differences seen in fear and reward responding in our reward-fear-safety discrimination paradigm. These are being accomplished using a multi-pronged approach to correlate (*in vivo* single unit electrophysiology; calcium imaging) and manipulate (chemogenetics) neural activity during awake behaviors.
