500-6-Dual Head Chuck Washer.

No. 509 Hose whip assembly complete

HINTS FOR LONGER LIFE AND BETTER SERVICE FROM YOUR MILTON INFLATOR GAGE

Use Only Gennine Milton Factory Packaged Units for Replacement

Keep air lines free from DIRT, WATER, and OIL . . . Drain your compressor tank regularly.

Screen trap in the threaded opening that attaches to the air line should be cleaned at regular intervals—accumulated dirt at this point slows up passage of air into the tire.

Never use gage to check pressure on tires filled with any puncture-proof liquids, chemicals, anti-static powders, or anti-freeze liquids as used on farm tractor tires.

Your Milton Inflator Gage should never be TAMPERED WITH, OILED, or dipped in any cleaning solution.

Replace air chuck washers periodically - worn chuck washers cause inaccurate readings.

NOTE . . . IMPORTANT . . . Use only bleeding type (open) free flowing chuck assemblies . . . ONE PIECE deflator pin for dual head chucks . . . Sealing Face Cut-Away pin for single head chucks - SEE ILLUSTRATION ON DIAGRAM OF HOSE WHIP ASSEMBLIES.

Do NOT use End of The Line Sealing Type Chucks . . . They trap the moisture and dirt from the air line and compressor into the gage hose. This moisture and dirt then backs-up into the gage itself, corrosion sets in causing premature failure. When the valve lever is depressed, a free flowing chuck head passes air whether or not the chuck is applied to the tire valve.

HANG UP YOUR GAGE WHEN NOT IN USE
